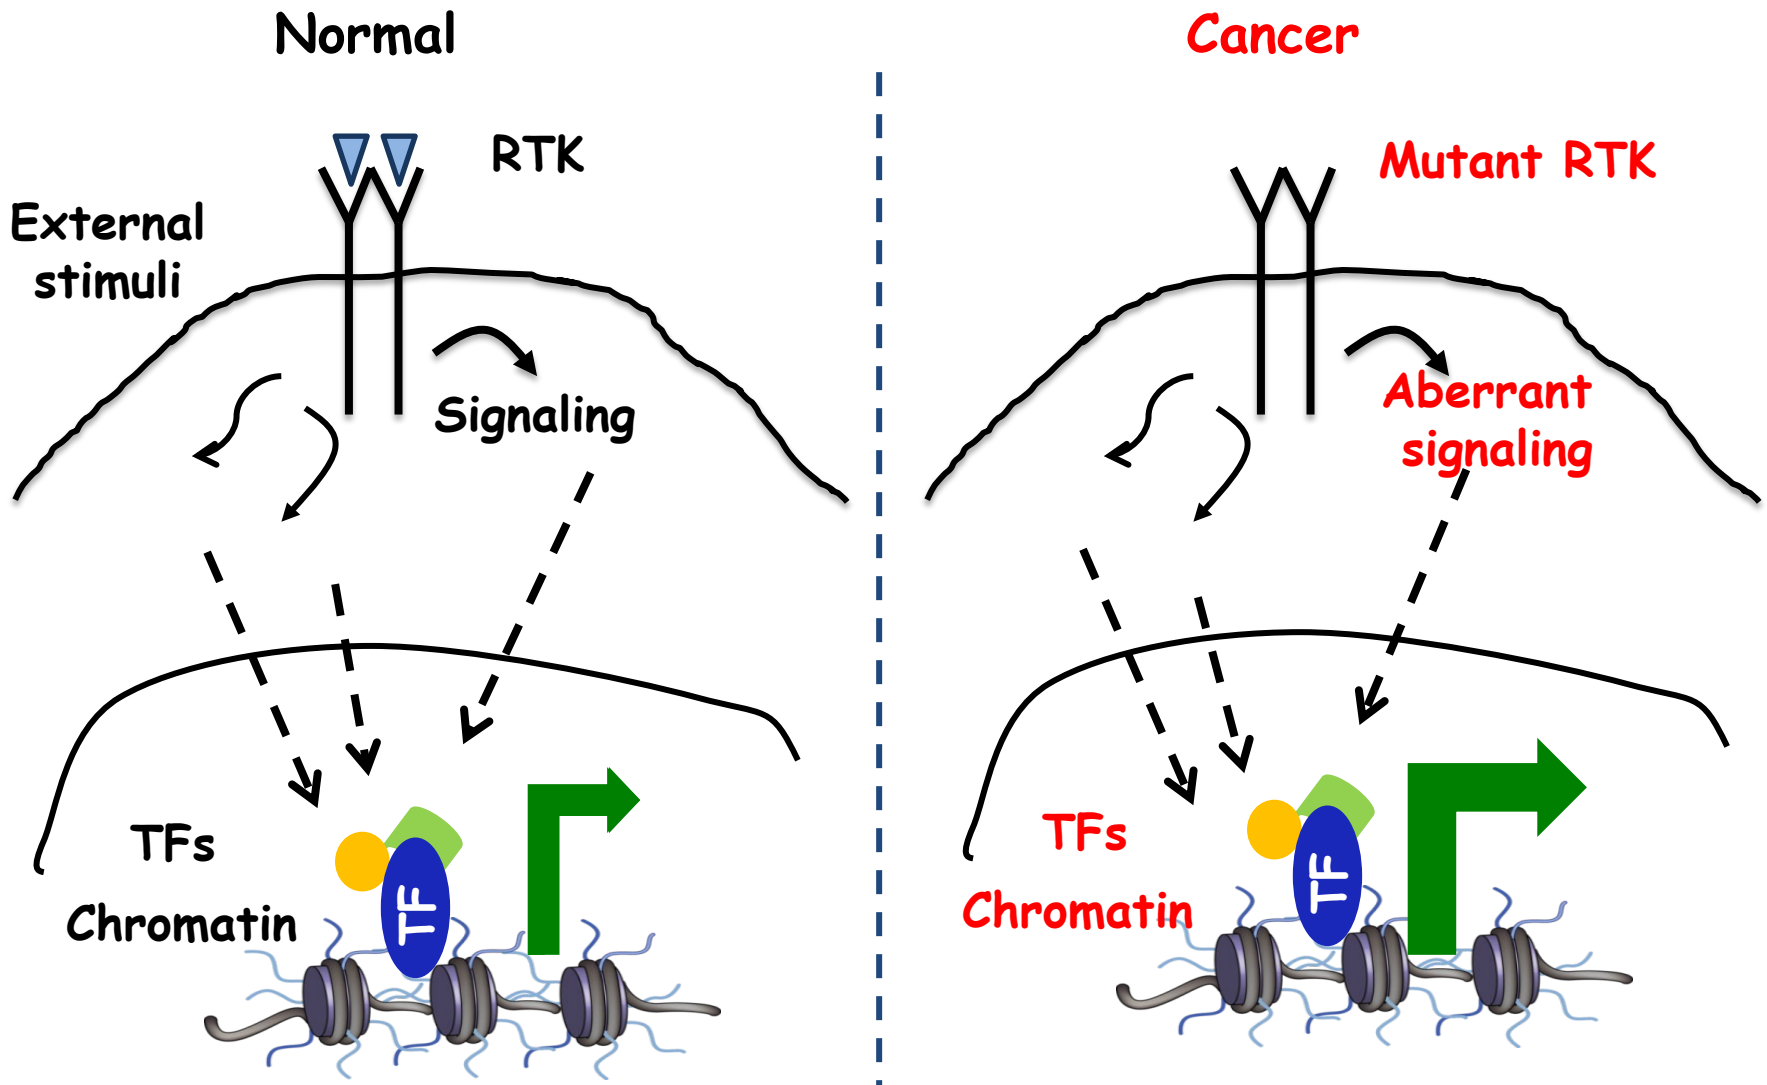
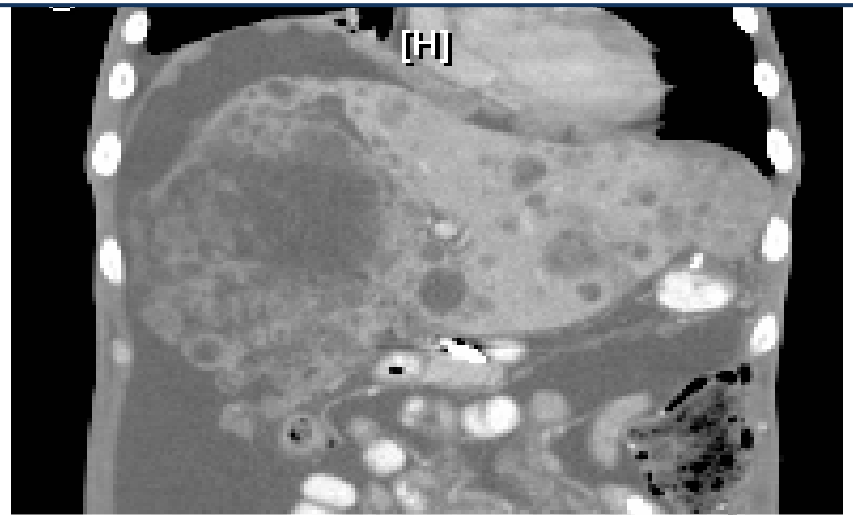
Genetic-epigenetic interaction in cellular context-dependent oncogenic transformation



Gastrointestinal stromal tumor (GIST)



Management:
- Surgery mainstay treatment
- Recurrence or metastatic disease - fatal
- Refractory to chemotherapy and radiation
- Imatinib is the first line therapy for past 20 years

- ~5,000 cases diagnosed per year in the US.

- One of the most common subtypes of soft tissue sarcomas, the most common mesenchymal neoplasm in the GI tract.

- Can arise anywhere from the entire GI tract; stomach is the most common primary site (2/3), then small bowel (1/4), esophagus/colon/rectum (the rest).

- Originates from Interstitial Cells of Cajal (ICCs).

- The majority of GISTs are characterized by KIT or PDGFRA activating mutations, other mutations include BRAFV600E, NF1 loss, SDH-deficiency, etc.

- Peak incidence 50–65-year-old for sporadic GIST. Familial syndromes with early onset.

GIST originates from ICC naturally express KIT

- Originates from the Interstitial Cells of Cajal (ICCs) of the GI tract
- Characterized by KIT positive IHC and activating mutations in KIT or PDGFRA

Interstitial Cell of Cajal (ICC)- Pacemaker cells of the GI tract

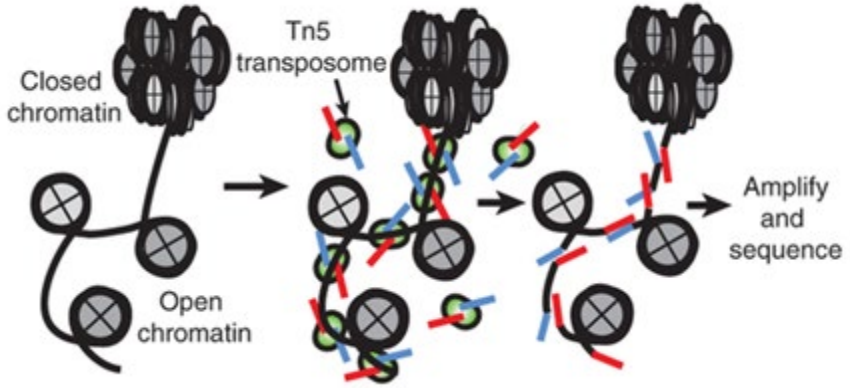
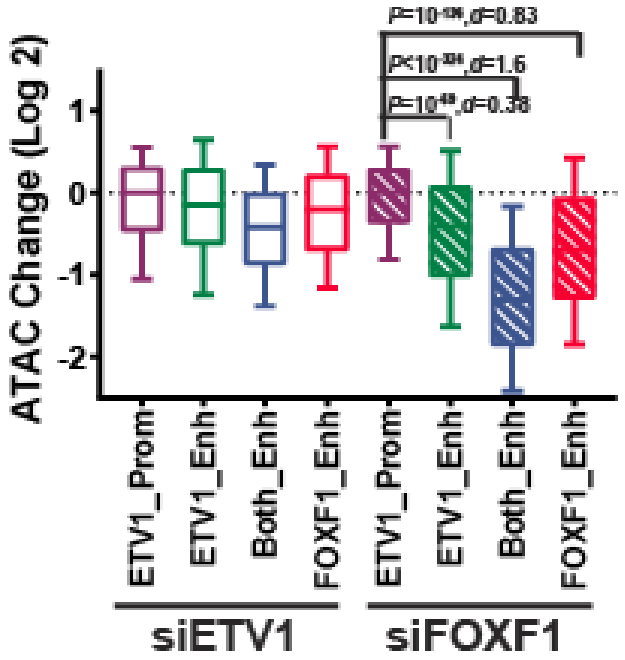
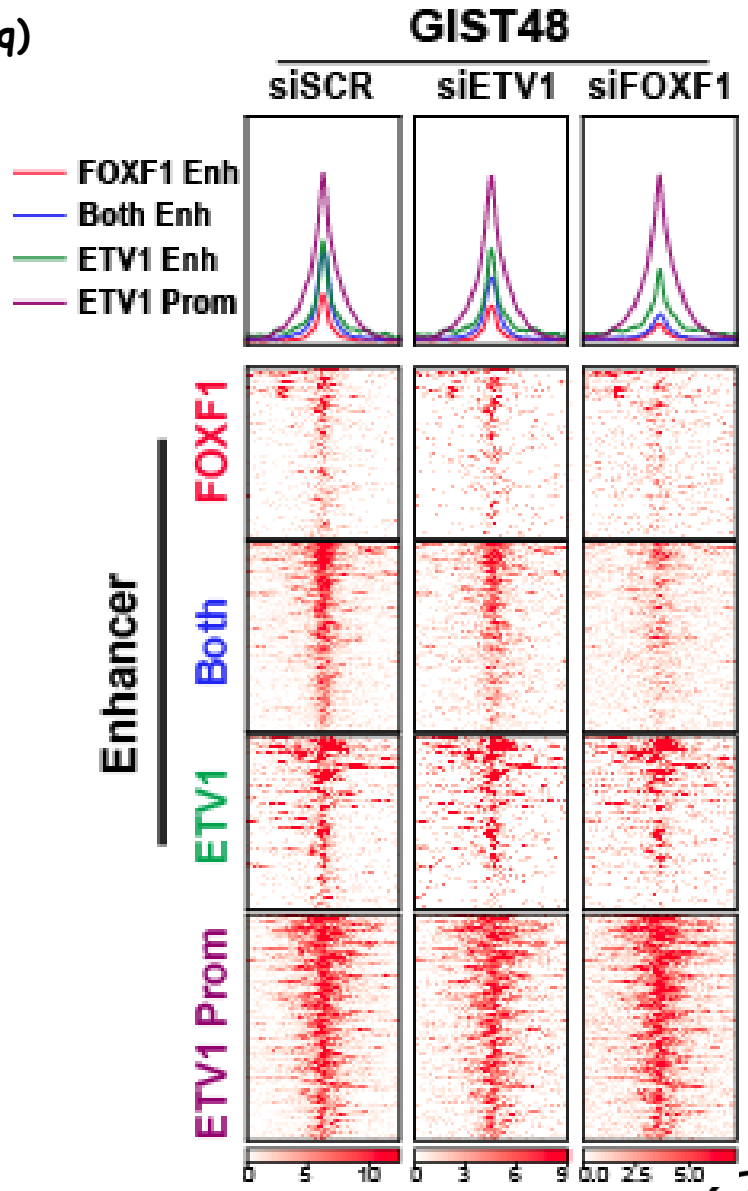
FOXF1 regulates chromatin accessibility in GIST

Assay for Transposase-Associated Chromatin (ATAC-seq)



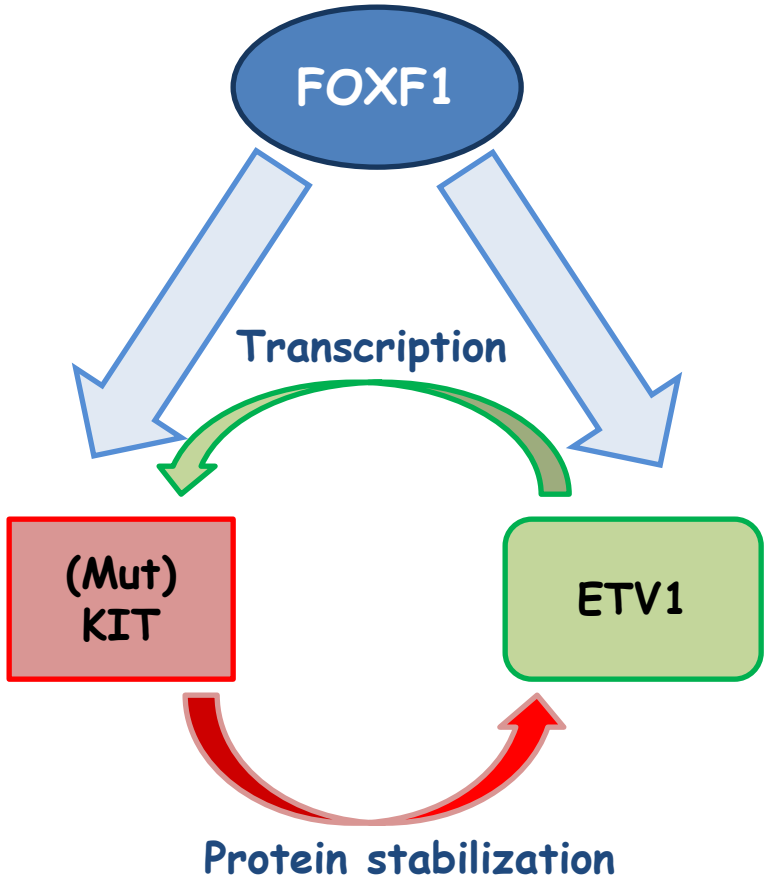




Buenrostro et. al. 2013 Nat Methods

Memorial Sloan Kettering Cancer Center

FOXF1 functions as a "pioneer factor" that enforces lineage-dependency in GIST pathogenesis



Multilevel transcriptional regulation

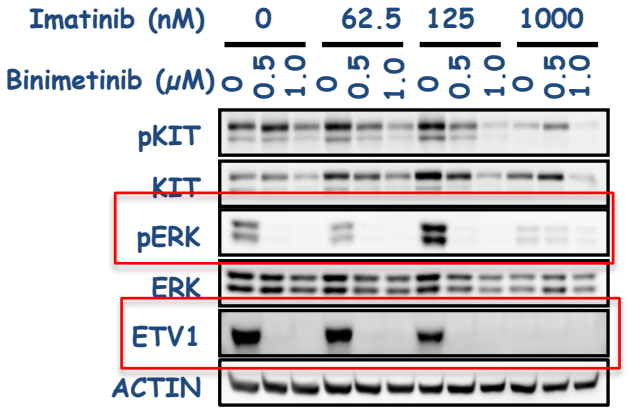
- Direct transcriptional activation of KIT
- Transcriptional regulation of masterregualtor-ETV1 (Cistrome regulation, Chromatin accessibility…)

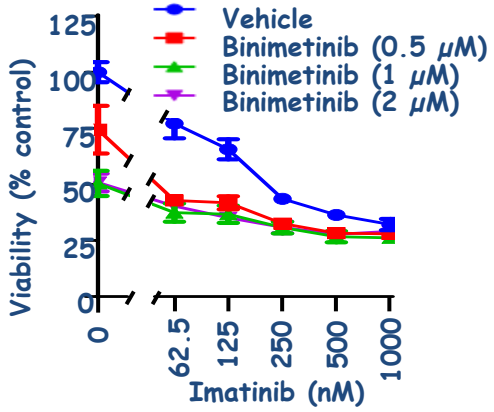
GIST-High lineage addiction

- dependent on KIT/PDGFRA signaling
- <1% dedifferentiation in treatment-refractory GIST

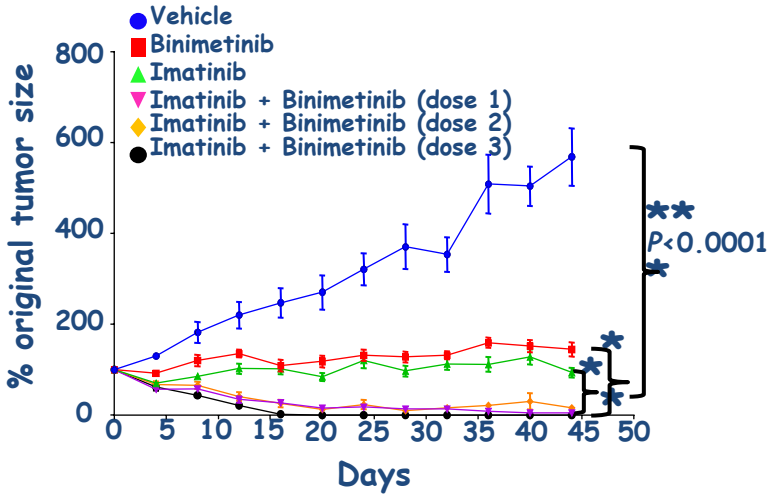
Synergy of combined MAPK and KIT pathway inhibition

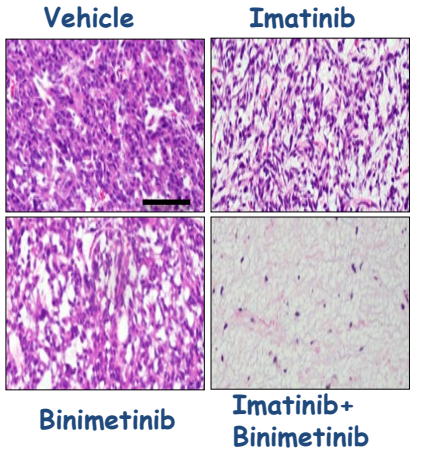
GIST882

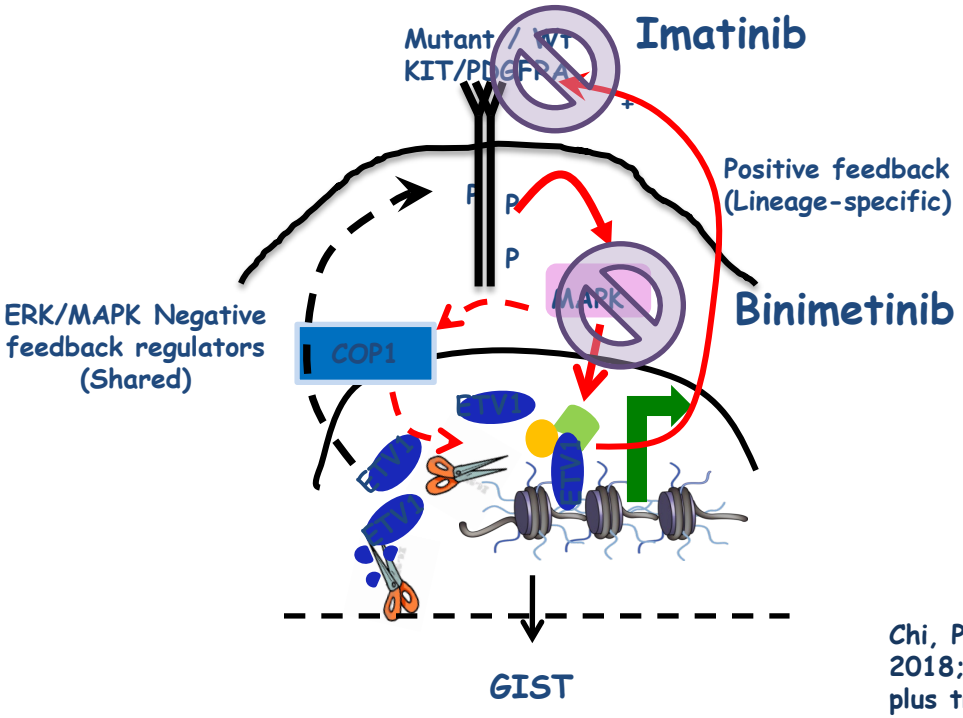




GIST882 xenografts







Advantage of targeting lineage dependence:

- Bypasses multiple upstream resistance mechanisms
- Break the positive feedback circuit of ETV1/KIT-target KIT expression regardless of mutations
- Block early adaptation and forestall resistance development and induces enhanced depth of cytotoxicity

A phase Ib/II trial of imatinib plus binimetinib in advanced GIST
- Positive trial ! Combination is also effective in SDH-deficient GIST

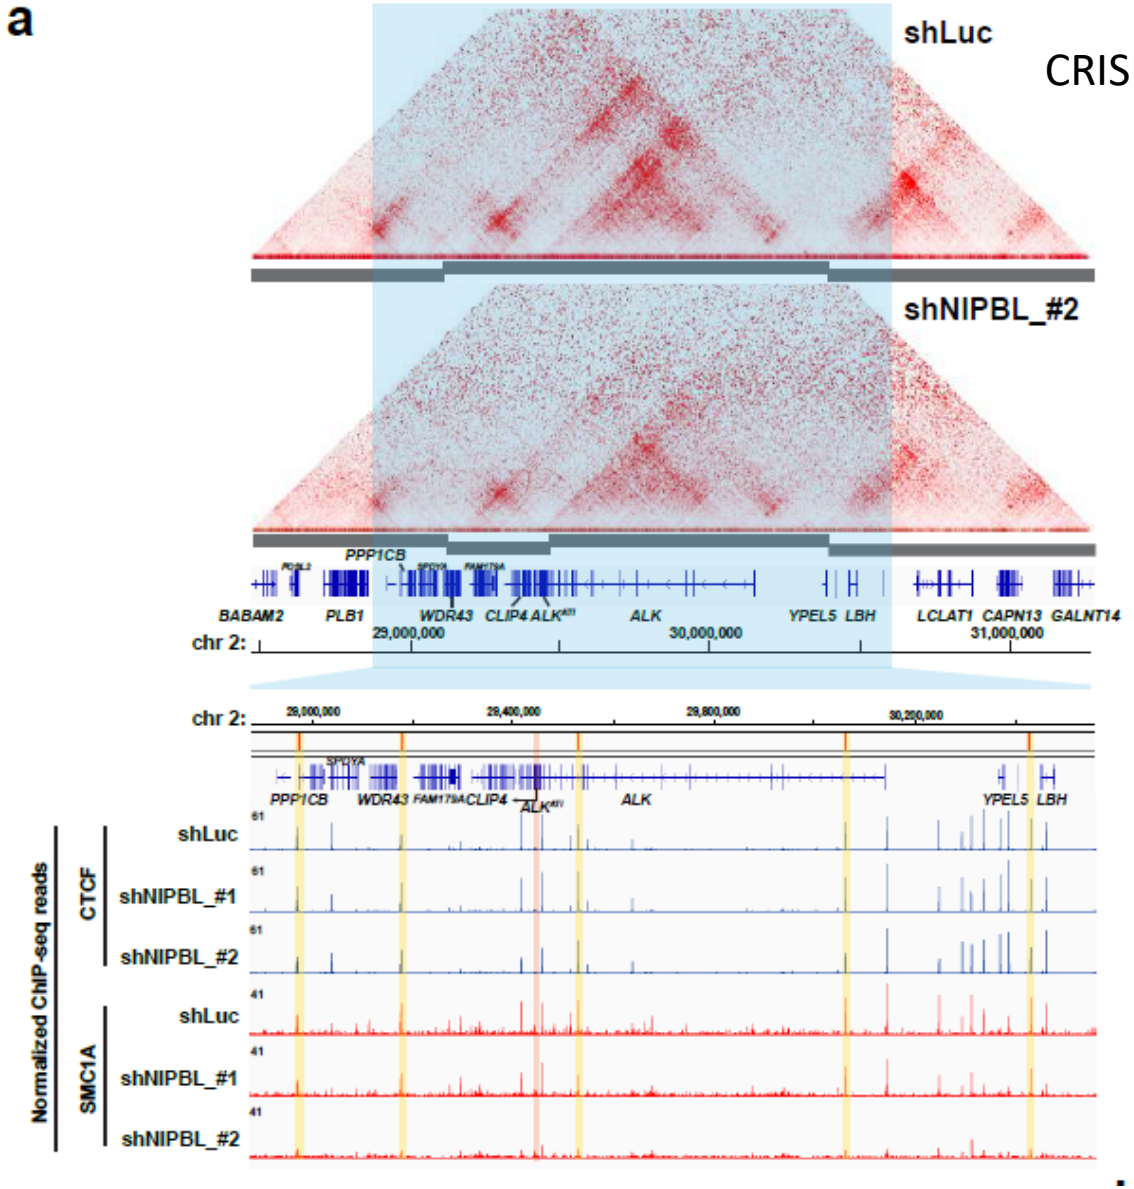
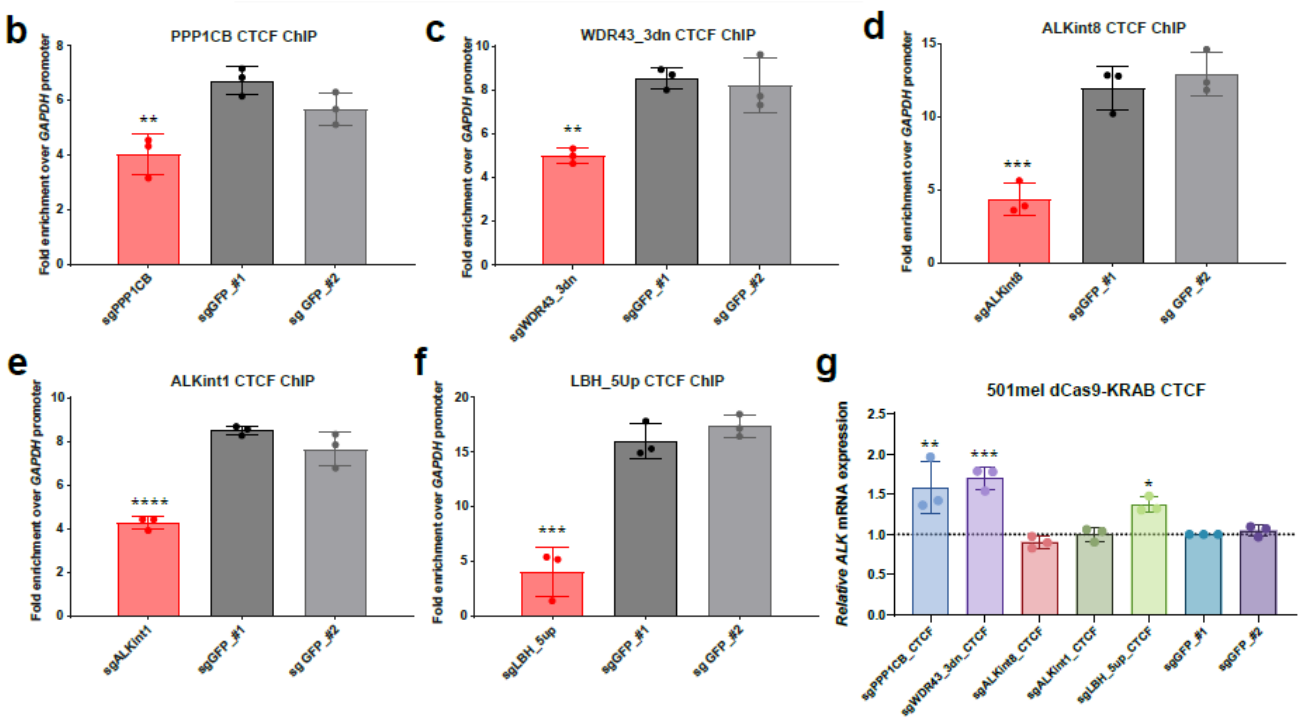
CRISPRi/CRISPR-Cas9-mediated TAD hierarchy loss results in alternative promoter activation



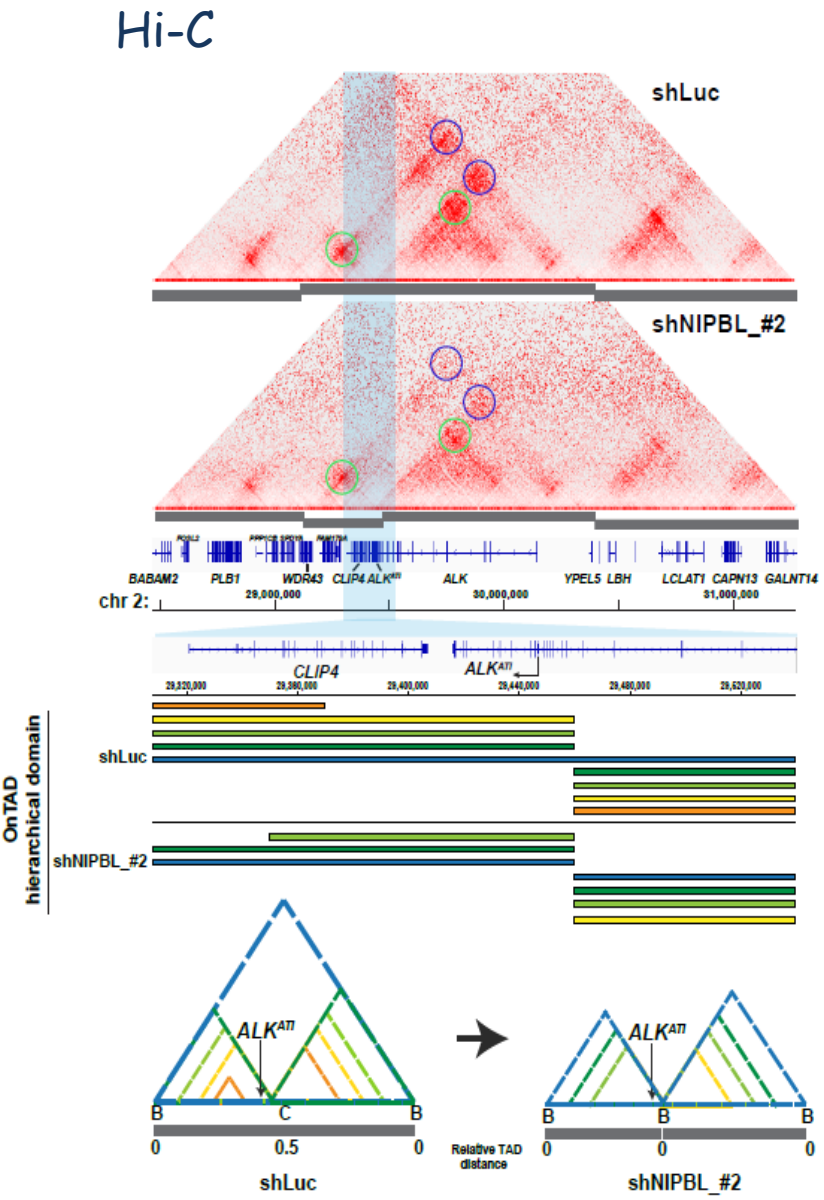
CRISPRi: dCas9-KRAB-mediated blocking of CTCF binding at TAD boundary

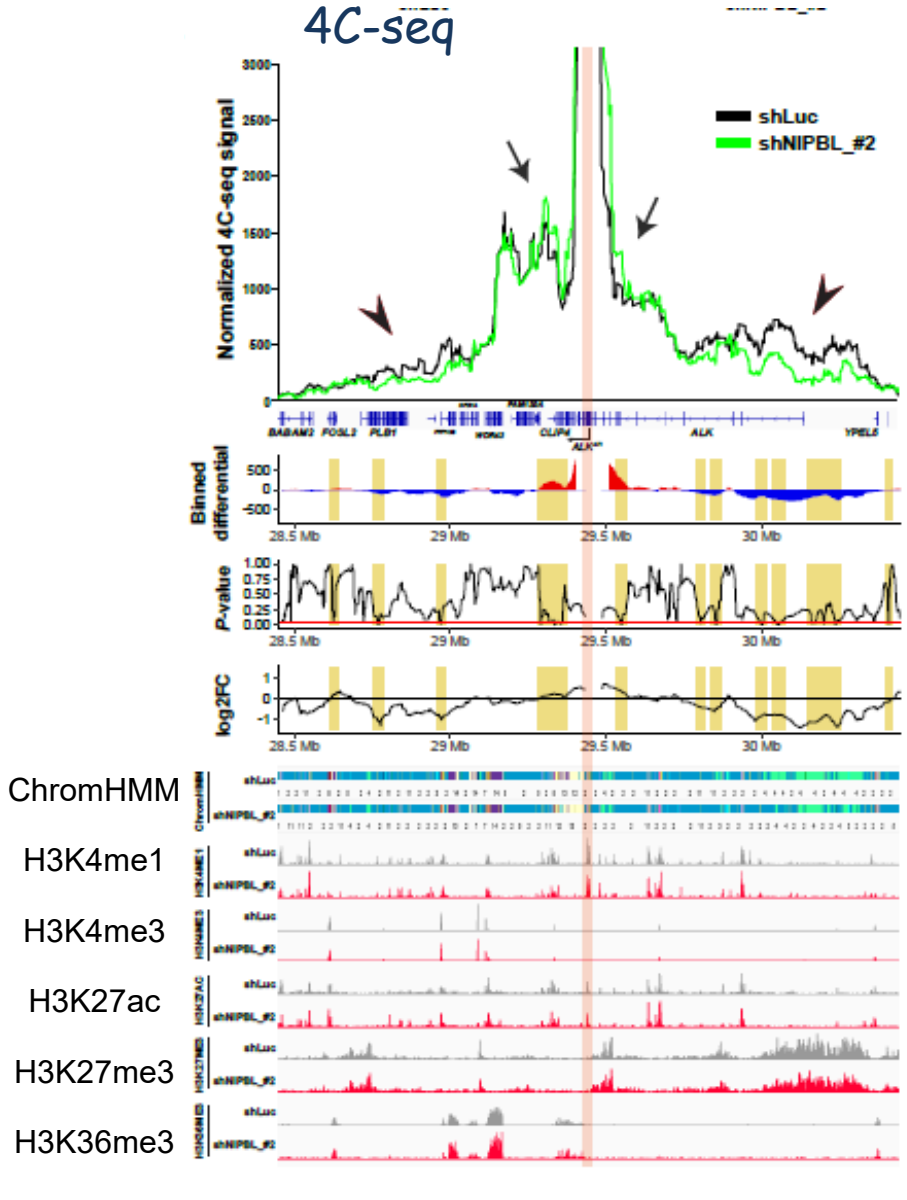


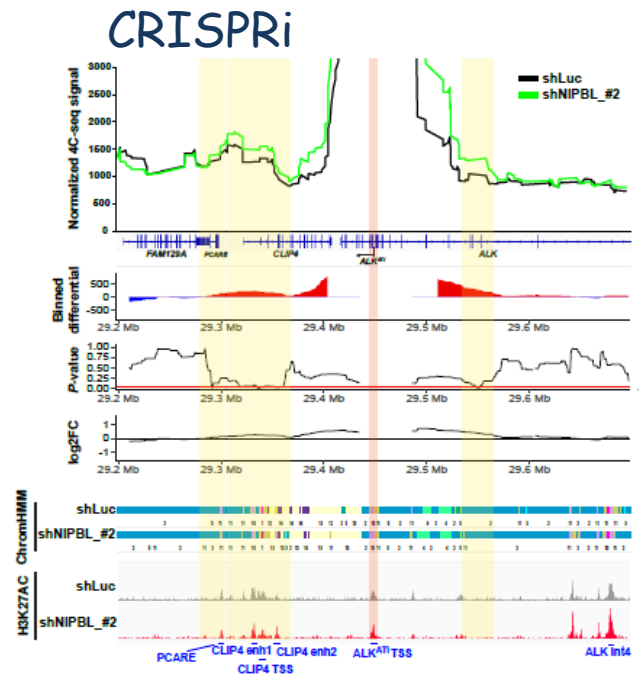
CRISPR/Cas9 of WDR43 CTCF sites similar observation

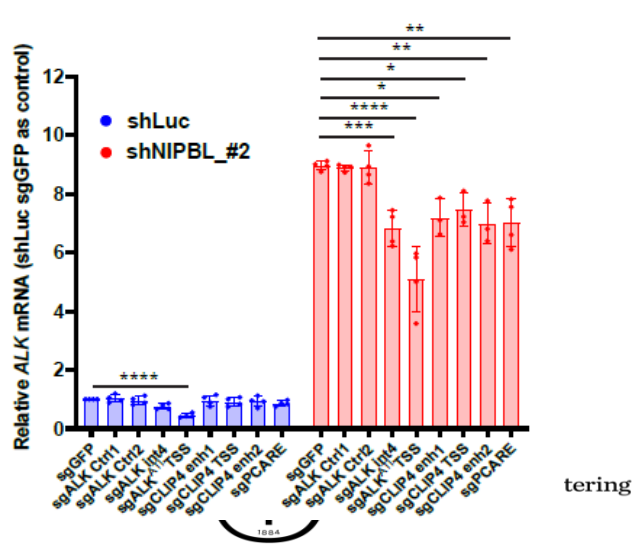
Memorial Sloan Kettering Cancer Center

TAD hierarchy loss results in alternative promoter activation from E-altP retargeting (switch from long-range E to short-intermediate range E)



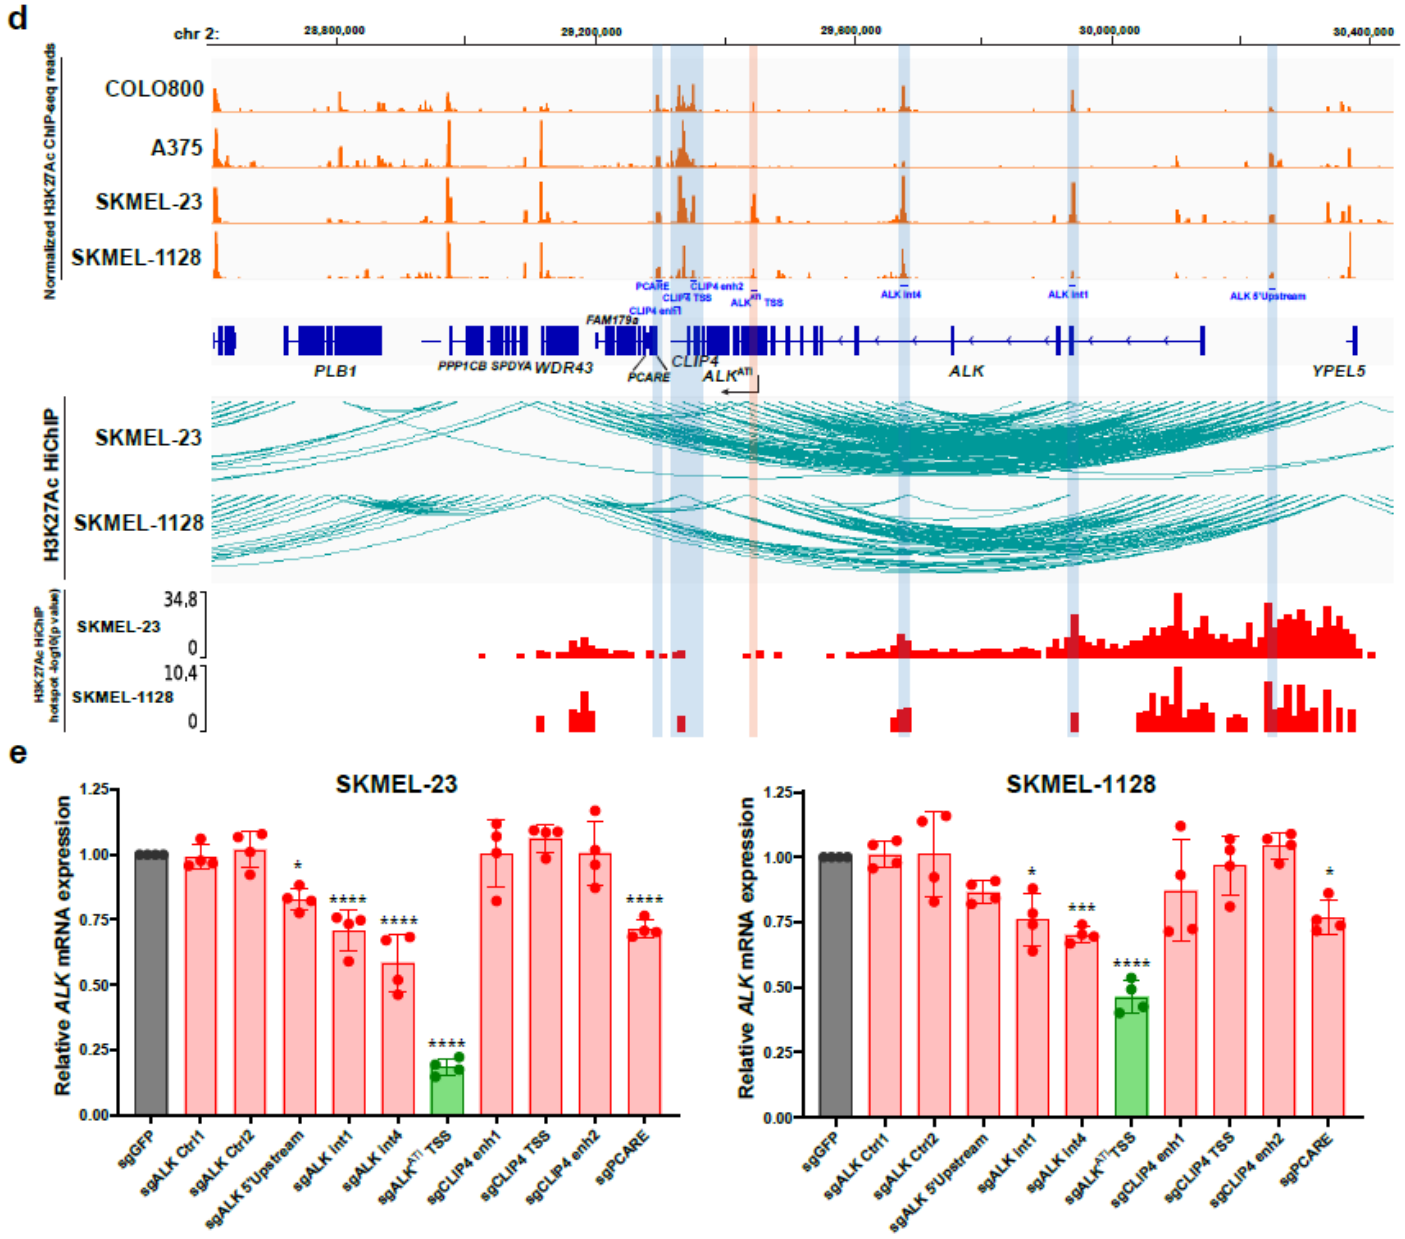






tering

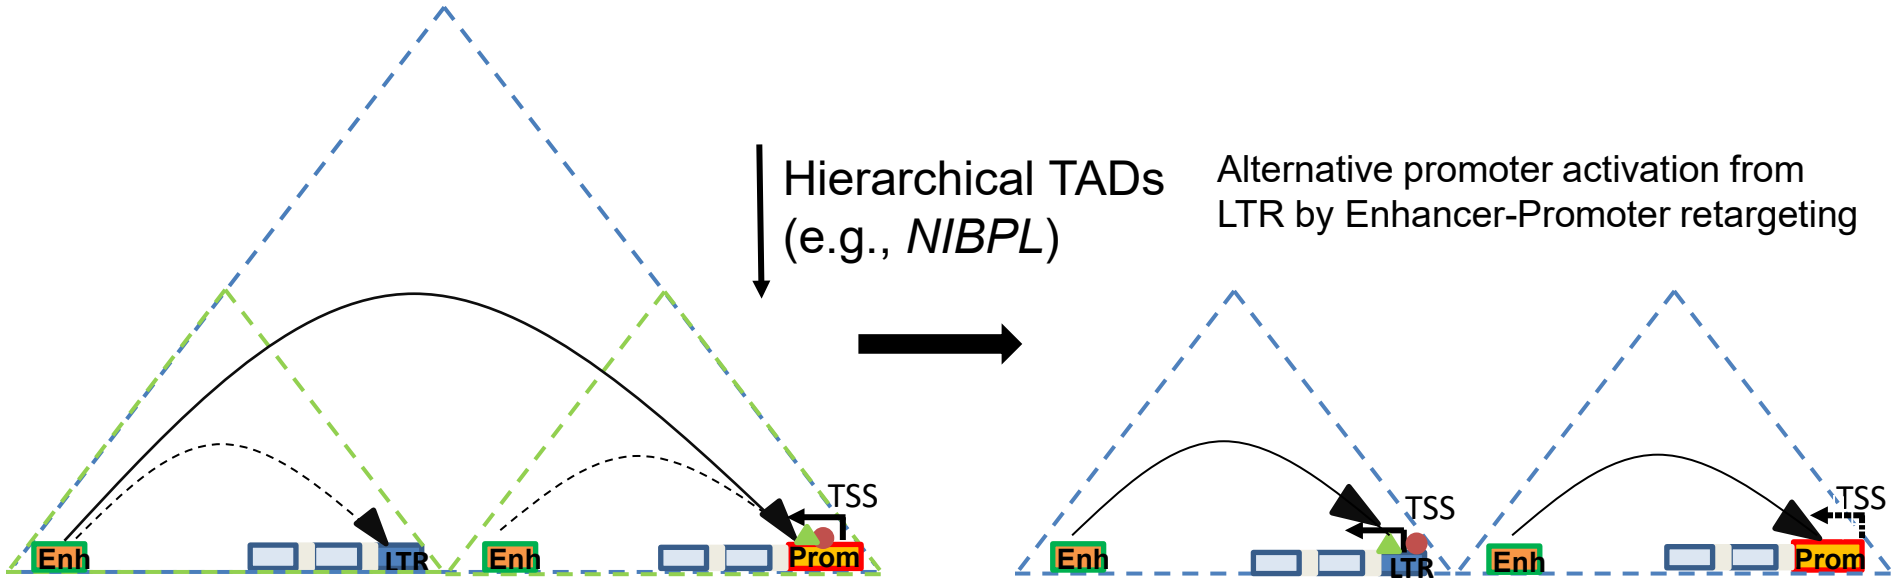
NIPBL perturbation contributes to transcriptional activation of *ALK*^{ATI} from the alternative promoter through enhancer re-targeting in melanoma



ALK^{ATI} expression is dependent on MITF

Memorial Sloan Kettering Cancer Center

Alternative promoter usage in cancer via perturbation in 3D chromatin hierarchy



Hierarchical 3D chromatin organization

Physiologically – Hierarchical TAD organization suppresses LTR-mediated spurious transcription and regulate LTR co-option, particularly in active chromatin compartment.

Pathologically – Perturbation in hierarchical TAD organization can lead to oncogene activation, transcriptional diversity/plasticity, neoepitope expression.
