

Immunotherapy Basic Principles

- Active vs Passive
- Specific vs Non-specific

Passive Immunotherapy

- Monoclonal Antibody (passive, specific)
- Checkpoint blockers (active, nonspecific)
- Immunotoxin (passive, specific)
- Interferon-alpha (non-specific)
- Interleukins (mixed)
- CAR T and Adoptive cell therapies (mixed)
- Vaccines (active; specific)

Why Antibodies?

- Specificity
- Range of targets
- Versatility
- Half-life
- Production; storage
- Long track record; many approved

Approved Anti-Cancer Antibody Drugs

Daclizumab	Zenapax	(anti-IL2 receptor CD25)	1997 (FDA approval date)
Rituximab	Rituxan	(anti-CD20)	1997*
Alemtuzumab	Campath	(anti-CD52)	2001
Traztuzumab	Herceptin	(anti-her2/neu)	1998
Gemtuzumab ozogomycin	Mylotarg	(anti-CD33)	2000; withdrawn at 10 yrs
Ibritumomab tiux.	Zevalin	(Y-90-anti-CD20)	2002
Tositumomab	Bexxar	(I-131-anti-CD20)	2003
Cetuximab	Erbix	(anti-EGFR)	2004
Bevacizumab	Avastin	(anti-VEGF)	2004
Panitumomab	Vectibix	(anti-EGFR)	2006
Ofatumumab	Arzerra	(anti-CD20)	2009**
Catumaximab	Removab	(anti-epcam Bisp)	2009 *EMEA
Denosumab	Prolia	(rank ligand)	2010
Ipilimumab	Yervoy	(anti-CTLA-4)	2011
Brentuximab vedotin	Adcetris	(CD30-aurastatin)	2011
Obinutuzumab	Gazyva	(anti-CD20)	2013*
Pertuzumab	Perjeta	(anti-her2/neu)	2013
Ado-trastuzumab emtansine	Kadcyla	(anti-her2/neu)	2013

Conjugates Bispecifics Checkpoint blockade Receptors Also receptor function ** plus enhanced

Approved Anti-Cancer Antibody Drugs - 2

Blinatumomab	Blinicyto	(CD19-CD3 BiTE)	2014
Ramucirumab	Cyramza	(anti-VEGFR-2)	2014
Siltuximab	Sylvant	(anti-IL6)	2014
Nivolumab	Opdivo	(PD1)	2014
Pembrolizumab	Keytruda	(anti-PD1)	2014
Dinutuximab	Unituxan	(anti-GD2)	2015
Atezolizumab	Tecentriq	anti-PD-L1	2016
Olaratumab	Lartruvo	PDGF-alpha	2016
Daratumumab	Darzalex	CD38	2016
Avelumab	Bavencio	anti-PD-L1	2017
Durvalumab	Imfinzi	anti-PD-L1	2017
Bevacizumab-awwb	Mvasi	Biosimilar (VEGF)	2017
Cemiplimab-rwlc	Libtayo	(anti-PD1)	2018
Moxetumomab pasudotox-tdfk	Lumoxiti	CD22-P38	2018
Mogamulizumab-kpkc	Poteligeo	CCR4	2018

- 13 mAb approved in first 15 years
- 15 approved in 2014-2018
- Only 3 naked cytotoxic mAb, not also working through a receptor
- Activity sometimes weak
- +25 more non-cancer mAb

Plus: > 12 biosimilar mAb's approved worldwide now

Efficacy and Safety of Alirocumab in Reducing Lipids

Calculated LDL Cholesterol Levels over Time (Intention-to-Treat Analysis).

Anti-PCSK9

Robinson, et al; NEJM, 372(16), 2015

Vedolizumab for Ulcerative Colitis

D

Anti-LPAM-1

Model of HuM195 – A Human IgG

Schema of an IgG

Fab Binding Pocket

Binding is over a large flat surface area

Cytochrome c

Fab

Ig structures: G, A, M

Fig. 2. The antibody structure. (a) Domain organization of an IgG molecule. Antigen-binding surface is formed by variable domains of the heavy (V_H) and light (V_L) chains. Effector functions are determined by constant C_H2 and C_H3 domains. (b) The dimeric secretory IgA (SIgA) and pentameric IgM structures. In SIgA, secretory component is wound around the SIgA dimer and attached by disulphide bonds to the C_α2 domain of each IgA monomer. The J-chain is required for joining the two subunits. The IgM heavy chains have five domains with disulphide bonds crosslinking adjacent μ_s chains. The IgM pentamer is the predominant polymeric form of IgM in vivo. Pentameric IgM normally contains a single additional polypeptide, the joining chain (J).

Enzymatic Cleavage of Ig

Independent domains
are key to functions and
engineering of mAb

Summary: Structure of Antibodies

- Bivalent/multivalent
- Large molecular mass
- Multifunctional
- Characterized by functional domains

How to Make a Monoclonal Antibody?

Immunize: mice, rabbit, llama, human.....

Take B cells...immortalize.... Clone cell

Screen library: phage, yeast....

clone sequence

Potential Cancer Targets of mAb

- Receptors: EGFR, IGFR, C-MET-r (HGF-r)
- Vascular antigens (not on cancer)
- Cell surface differentiation antigens
- Soluble growth factors and ligands
- Matrix integrins; mucins; glycosphingolipids
- Apoptosis enhancers (Trail-R)
- Immune modulators (checkpoints- not on cancer)
- Internal antigens (after MHC presentation)
- Post-translational modifications

Now: Targets are all Outside of Cell

Antigen category	Examples of antigens	Tumor types expressing antigen
Cluster of differentiation (CD) antigens	CD20	non-Hodgkin lymphoma
	CD30	Hodgkin lymphoma
	CD33	Acute myelogenous leukemia
	CD52	Chronic lymphocytic leukemia
Glycoproteins	EpCAM	Epithelial tumors (breast, colon, lung)
	CEA	Epithelial tumors (breast, colon, lung)
	gpA33	Colorectal carcinoma
	Mucins	Epithelial tumors (breast, colon, lung, ovarian)
	TAG-72	Epithelial tumors (breast, colon, lung)
	Carbonic anhydrase IX	Renal cell carcinoma
	PSMA	Prostate carcinoma
	Folate binding protein	Ovarian tumors
Glycolipids	Gangliosides (e.g., GD2, GD3, GM2)	Neuroectodermal tumors, some epithelial tumors
Carbohydrates	Lewis-Y ²	Epithelial tumors (breast, colon, lung, prostate)
Vascular targets	VEGF	Tumor vasculature
	VEGFR	Epithelium-derived solid tumors
	α V β 3	Tumor vasculature
	α 5 β 1	Tumor vasculature
Growth factors	ErbB1/EGFR	Glioma, lung, breast, colon, head and neck tumors
	ErbB2/HER2	Breast, colon, lung, ovarian, prostate tumors
	ErbB3	Breast, colon, lung, ovarian, prostate tumors
	c-MET	Epithelial tumors (breast, ovary, lung)
	IGF1R	Lung, breast, head and neck, prostate, thyroid, glioma
	EphA3	Lung, kidney, colon, melanoma, glioma, hematological malignancies
	TRAIL-R1, TRAIL-R2	Solid tumors (colon, lung, pancreas) and hematological malignancies
	RANKL	Prostate cancer and bone metastases
Stromal and extracellular matrix antigens	FAP	Epithelial tumors (colon, breast, lung, head and neck, pancreas)
	Tenascin	Glioma, epithelial tumors (breast, prostate)

Scott, Allison, Wolchok. *Cancer Immunology*, 2012.

Strategies for Antibody Therapy

Complement Mediated Cytotoxicity: CMC

Antibody Dependent Cellular Cytotoxicity: ADCC

Antibody Dependent Cellular Cytotoxicity: ADCC

Bispecific mAb:
BiTEs

Drugging Undruggable Targets via HLA Presentation

Killing with Cells: TCR, ICB, Vaccines

WT1 TCRm mAb Contact Region Allows Binding to Other A02 Subtypes and Other Proteomic Off-Targets

Also mapped HLA-A*02-subtype differences:

Positional differences between the HLA subtypes: A*02:02, A*02:03, A*02:05, A*02:06, A*02:07, and yellow: A*02:11..
None of the residues that vary between A*02 subtypes contacts ESK1.

Engineering the First BiTE Derived from TCR-mimic mAb, ESK1

Modified from Exp. Cell Res. 317:1255, 2011

Mechanisms to Make Bispecifics

Strategies and mutations to overcome the BslgG heavy chain-pairing problem.

Company	Technology Name	Mutations in first heavy chain	Mutations in second heavy chain	Reference
Genentech	Knobs-into-holes	T366W	T366S, L368A, Y407V	Ridgway et al. (1996) , Atwell et al. (1997)
Genmab	DuoBody	F405L	K409R	Labrijn et al. (2013)
Zymeworks	Azymetric	T350V, L351Y, F405A, Y407V	T350V, T366L, K392L, T394W	Von Kreudenstein et al. (2013)
Amgen	Charge pair	K409D, K392D	D399K, E356K	Gunasekaran et al. (2010)
Rinat-Pfizer	Charge pair	D221E, P228E, L368E	D221R, P228R, K409R	Strop et al. (2012)
Xencor	HA-TF	S364H, F405A	Y349T, T394F	Moore et al. (2011))
EMD Serono	SEEDbody	IgG/A chimera	IgA/G chimera	Davis et al. (2010)
Regeneron	Differential protein A affinity	H435R	None	Davis et al. (2013)

Bispecific Antibody Targets

Effector cell	Trigger molecule	Objective
T cells	TCR/CD3	Tumor cytotoxicity
NK cells	CD2	Tumor cytotoxicity
	FcγRIIIa (CD16)	Kill virus-infected cells
	CD38	
	CD44	
	CD56	
	CD69	
Granulocytes	FcγRI (CD64) (activated cells)	Tumor cytotoxicity
	FcαRI (CD89)	Kill pathogens
	CR3 (CD11b/CD18)	
Monocytes/ Macrophages	FcγRI (CD64)	Tumor cytotoxicity
	FcαRI (CD89)	Kill pathogens
	CR3 (CD11b/CD18)	↑ Antigen presentation
	Mannose receptor	
Dendritic cells	FcγRI (CD64)	↑ Antigen presentation
	Mannose receptor	
Erythrocytes	CR1 (CD35)	Clearance of pathogens/ Immune complexes

Abbreviations: CR, complement receptor; FcR, Fc receptor; TCR, T-cell receptor.

Strategies for Antibody Therapy: ADEPT and ADAPT

Anti-Id Vaccine

Multifunctional Antibodies – 1

Rituximab anti-CD20

- ADCC
- CMC
- Decrease MAPK, AKT, IL10, BCL-2, P-Gp
- Increase ceramide signaling, apoptosis

Multifunctional Antibodies – 2

Traztuzumab anti-her-2

- Blocks HER2 signaling (MAPK, PI3K)
- Increases HER2 degradation
- Results in cell cycle arrest, apoptosis
- ADCC
- Anti-angiogenic
- Decreased HER2 proteolysis & soluble form

Antibodies as Immune Modulators

- Bound antigen presented by APC to T cells
- Activating FcR receptor
- Inactivating FcR receptors
- Use as Anti-idiotypic vaccine
- Checkpoint Blockade: PD1, CTLA-4, Tim3, CD47/SIRP-a...

Cancer Cells Tell the Immune System: “Do Not Eat Me”

 CD47 protein says
“Do Not Eat Me”

Macrophages might normally eat cancer cells,
but cancer cells evade being eaten.

 SIRPα analog drug
blocks CD47 message

Role of PD-1 Pathway in Suppressing Anti-Tumor Immunity

Recognition of tumor by T cell through MHC/antigen interaction mediates IFN γ release and PD-L1/2 up-regulation on tumor

Priming and activation of T cells through MHC/antigen & CD28/B7 interactions with antigen-presenting cells

Overall Survival in Melanoma

Patients at risk:

NIVO+IPI	314	292	265	247	226	221	209	200	198	192	170	49	7	0
NIVO	316	292	265	244	230	213	201	191	181	175	157	55	3	0
IPI	315	285	254	228	205	182	164	149	136	129	104	34	4	0

Summary: Functions of Antibodies

- Binding
- Opsonization
- Complement activation
- FcR Binding (ADCC)
- Crosslinking
- Signaling
- Antagonism of signaling
- Activation/inhibition of the immune system

Antibodies Can Be Toxic

- Pancytopenia
- BM hypoplasia
- ITP. (platelet loss)
- AHA. (blood loss)
- Sepsis: bacterial, fungal, viral, protozoal
- Opportunistic infections
- Hyper-activation of immune system

Form a Biotech Company: “GSK BioSciences”

Form 3 Teams: Design a Drug Platform

Challenge team 1: Your target is a cell surface protein found overexpressed on breast cancer cells (Her2), but also on some normal tissue.

Challenge team 2: Your target is a pancreas cancer protein inside the cell that is mutated in a single amino acid (KRAS).

Challenge team 3: Your target is on a tumor in the Brain (EGFRVIII).

Antibodies as Carriers

- Drugs
- Toxins
- Containers (e.g. liposomes)
- Isotopes
- Genes/viruses
- Enzymes (e.g. ADEPT)
- Cytokines
- Cells

Ig-Antigen complexes internalize

Using Ig-Ag internalization to deliver toxins

Ig- plant hemi-toxins

Immunotoxin

Type I

Type II

Antibody-Drug Conjugates (ADC's)

mAb-doxorubicin (hydrazone)

mAb-calicheamicin (hydrazone)

mAb-DM1 (disulfide)

mAb-auristatin (peptide)

Toxin-Antibody Conjugate Issues

- Potency
- Size
- Immunogenicity
- Internalization/ compartmentalization

Drug-Antibody Conjugate Issues

- Linkage and release or lack of release
- Potency
- Resistance
- Internalization/compartmentalization
- Specificity
- Clearance/metabolism
- Prodrugs

Antibody-Chelate-Radionuclide Construct

Imaging of ^{111}In -HuM195

Day 0

Day 1

Day 2

Day 3

Alpha and Beta Particle Radioimmunotherapy

Comparison of ^{131}I and ^{90}Y

	Iodine-131	Yttrium-90
Particulate energy (keV)	610	2280
Mean path length (mm)	0.8	5.3
Half-life (days)	8.1	2.7
Gamma emissions	Yes	No
Retention after internalization	+/-	++

Alpha Particle Emission

Alpha decay. The nucleus breaks down to form an atom with two fewer neutrons and two fewer protons. Also given off is an alpha particle, which is effectively a helium atom.

Targetable Atomic Nano-Generator

Isotope Drug Conjugate Issues

- Emission Characteristics and complexity
- Alpha vs Beta vs Gamma
- Half-life
- Stability
- Metabolism/ daughters/ clearance

Why Not Antibodies?

- Not oral agents
- Immunogenicity
- Pharmacokinetics/diffusion
- Half-life
- Antigen Heterogeneity/selection
- Resistance

Easier Routes of Administration of mAb

Rituximab serum through concentrations by induction treatment cycle

Davies, et al; Lancet Oncology, 15(3), 2014

Antibody Penetration is Slow

Confocal microscopy slices through the equator of LNCaP spheroids following incubation with 10 $\mu\text{g/ml}$ FITC-J591 and wash (3x).

Cancer Specificity through Drug Delivery Decisions

Allowing cell-based drugs to make smart decisions.

These decision gates can be applied to the Targeted Cellular Micropharmacies, yielding smarter, Targeted Cellular Micropharmacists

1966: Fantastic Voyage

Allowing CAR T Cells to Make Logical Decisions on When to Act

Traditional CAR T cell: *always ON*

“Gated” CAR T cell: *uses an ON-switch*

SynNotch system first described by Lim

mAb Development Issues

Monoclonal Antibodies

- Easy to make to any target quickly
- Predictable PK
- Predictable, usually minimal, toxicity
- Few off target effects
- Clear pathway to market
- Fastest growing class of cancer drugs
- CAR T are very expensive & patient specific
- BiTes has short T1/2 in vivo

Small Molecules

- Usually far cheaper to manufacture
- Usually more stable
- Structure better definable
- IP simpler, but generic possible
- PO, IV, SC available

mAb Pharmacology

	Monoclonal Antibody	Small Molecules
Kinetics	long (weeks)	short (min – hours)
Bioavailability	Oral: very poor	varies
PK analysis	can be imaged	sampling
Immunogenicity	occasional	rare with drugs
MDR/ Cross-resistance	unlikely	yes
Cross-toxicity	less often	yes

mAb Biodistribution & Availability

- Small molecules far better
- Monoclonal antibody
 - not orally available
 - do not penetrate CNS well
 - enter tissues and tumors slowly
(poor penetration may reduce toxicity)

Form a Biotech Company: “GSK Microdelivery Systems”

Form 2 Teams: Design a drug and a back up drug

Challenge Team 1: Your target is ganglioside GD2 on lung cancer cell's surface.

Challenge Team 2: Your target is a lineage marker protein CD33 on leukemia cells that rapidly internalizes into the cell.
