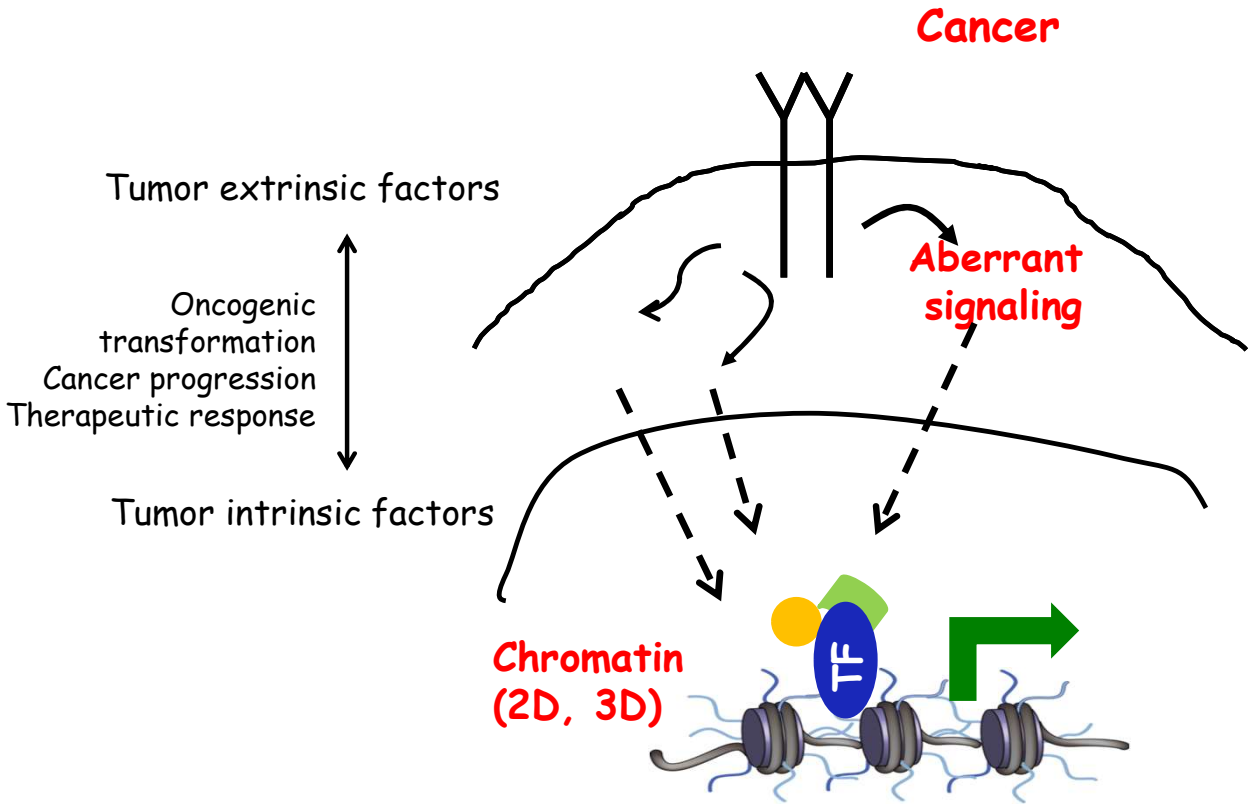
Genetic-epigenetic interaction in cellular context-dependent tumorigenesis



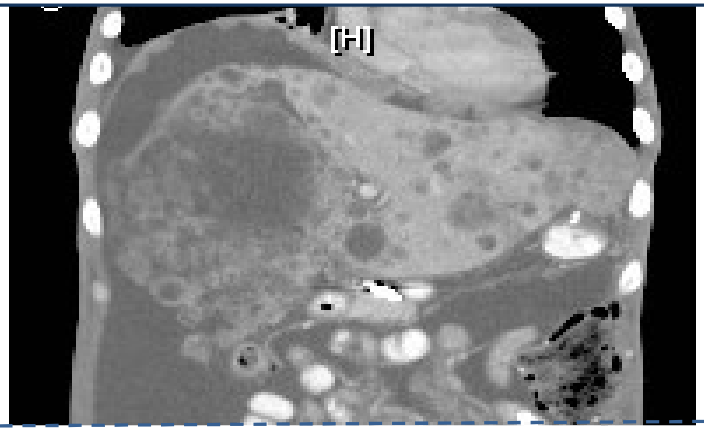
Three main themes:

- Oncogenic TF networks.
- Chromatin modifiers complex perturbations.
- 3D chromatin organization and alternative promoter usage in cancer.

Memorial Sloan Kettering Cancer Center

Sarcomas (GIST, MPNST, Angiosarcomas, etc.),
Melanomas (uveal, cutaneous), others

Gastrointestinal stromal tumor (GIST)



Management:
- Surgery mainstay treatment
- Recurrence or metastatic disease - fatal
- Refractory to chemotherapy and radiation
- Imatinib is the first line therapy for past 25 years

- ~5,000 cases diagnosed per year in the US.

- One of the most common subtypes of soft tissue sarcomas, the most common mesenchymal neoplasm in the GI tract.

- Can arise anywhere from the entire GI tract; stomach is the most common primary site (2/3), then small bowel (1/4), esophagus/colon/rectum (the rest).

- Originates from Interstitial Cells of Cajal (ICCs).

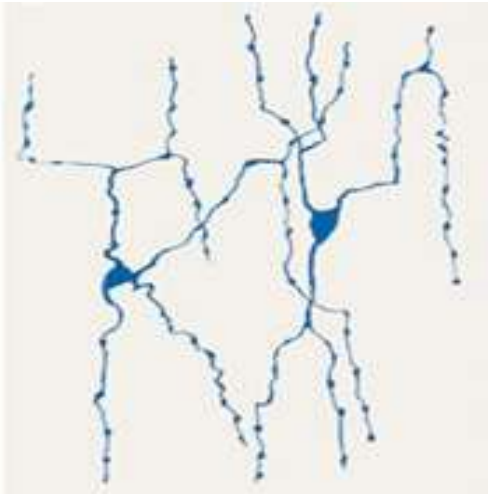
- The majority of GISTs are characterized by KIT or PDGFRA activating mutations, other mutations include BRAFV600E, NF1 loss, SDH-deficiency, etc.

- Peak incidence 50–65-year-old for sporadic GIST. Familial syndromes with early onset.

GIST originates from ICC naturally express KIT

- Originates from the Interstitial Cells of Cajal (ICCs) of the GI tract
- Characterized by KIT positive IHC and activating mutations in KIT or PDGFRA

Interstitial Cell of Cajal (ICC)- Pacemaker cells of the GI tract



GIST of stomach

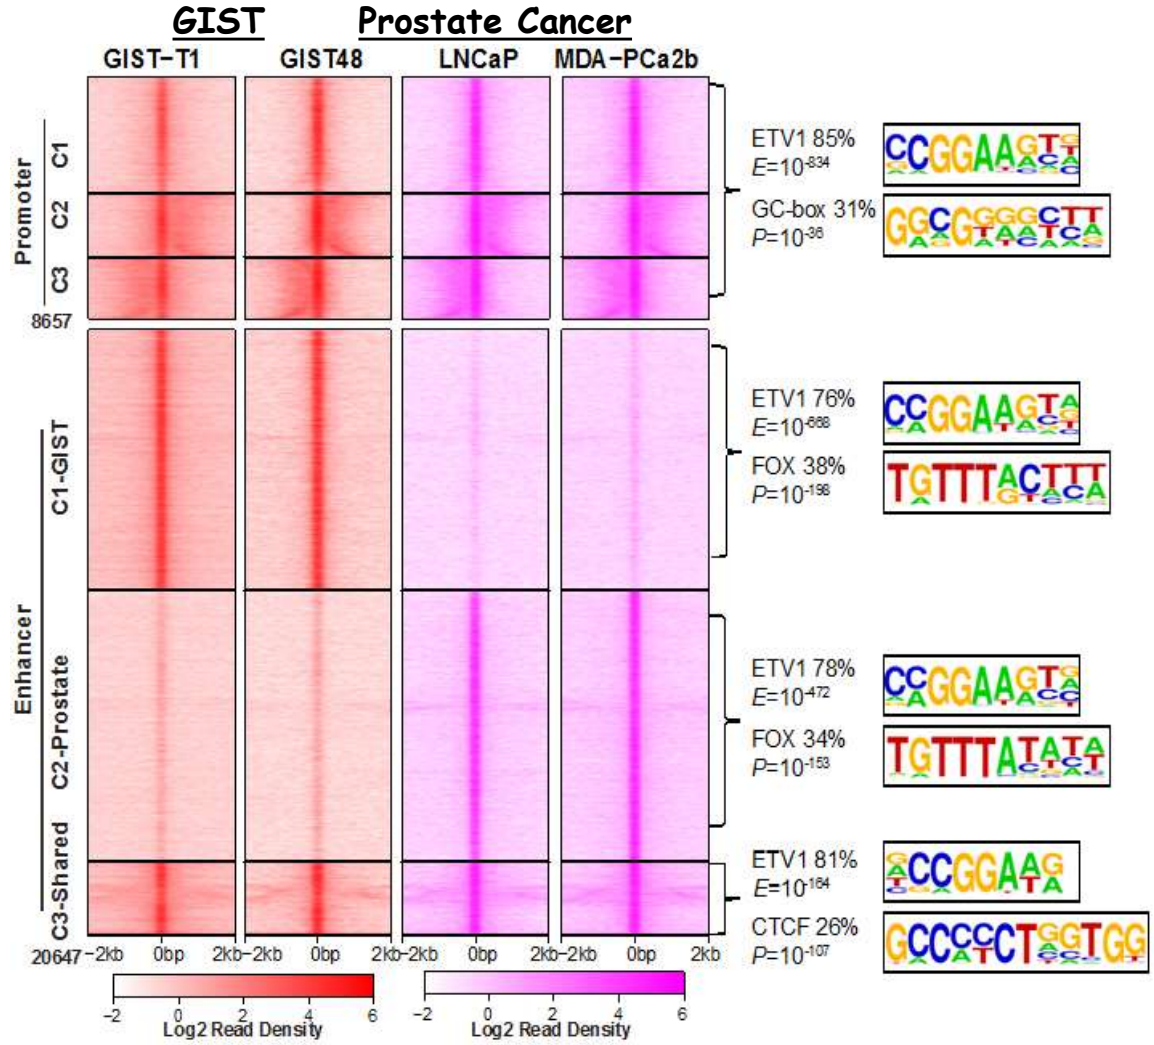
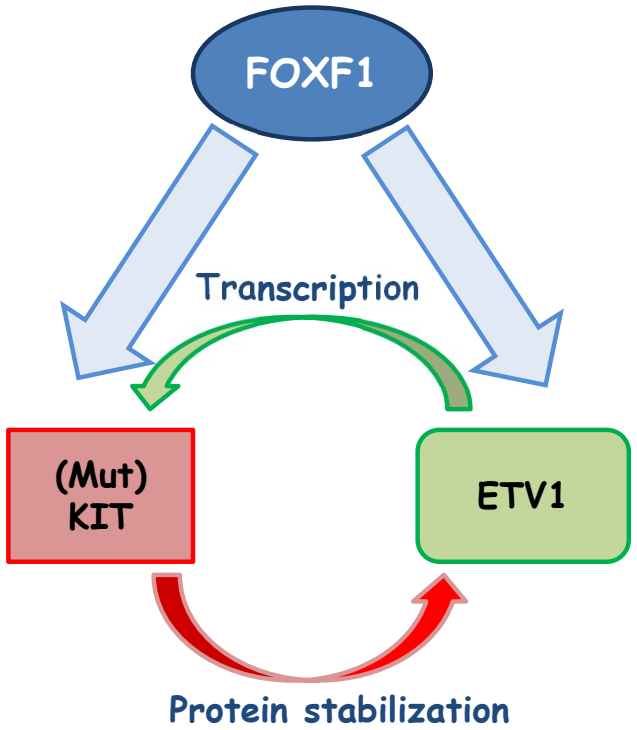
ETV1 cistrome analysis



Ran L, Chen Y, et al., Cancer Discovery 2018

Memorial Sloan Kettering Cancer Center

FOXF1 functions as a "pioneer factor" that enforces lineage-dependency in GIST pathogenesis



Multilevel transcriptional regulation

- Direct transcriptional activation of KIT
- Transcriptional regulation of masterregualtor-ETV1 (Cistrome regulation, Chromatin accessibility, integrate with transcription)

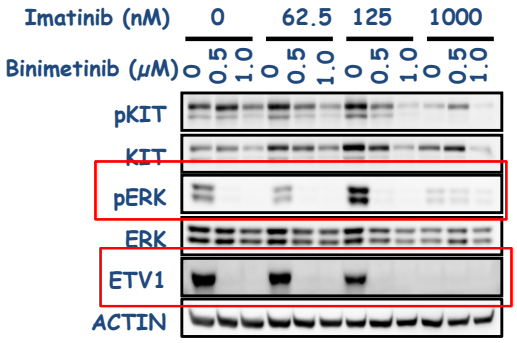
GIST-High lineage addiction

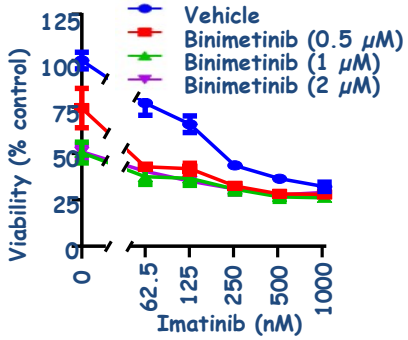
- dependent on KIT/PDGFRA signaling
- <1% dedifferentiation in treatment-refractory GIST

Memorial Sloan Kettering Cancer Center

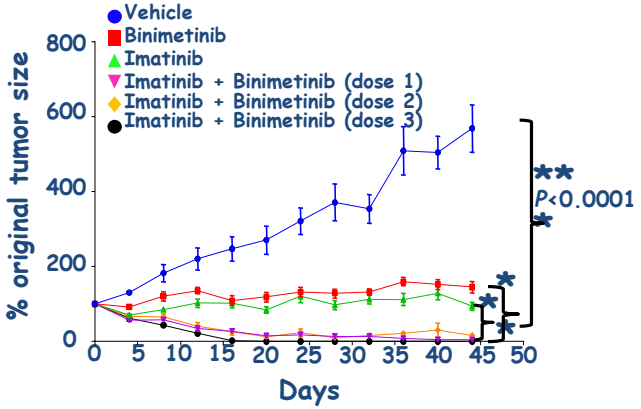
Synergy of combined MAPK and KIT pathway inhibition

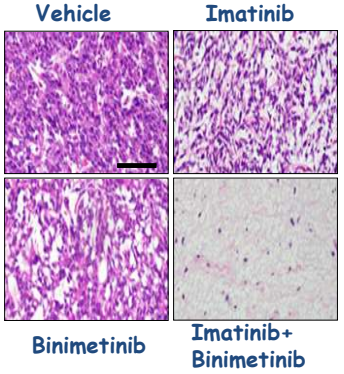
GIST882

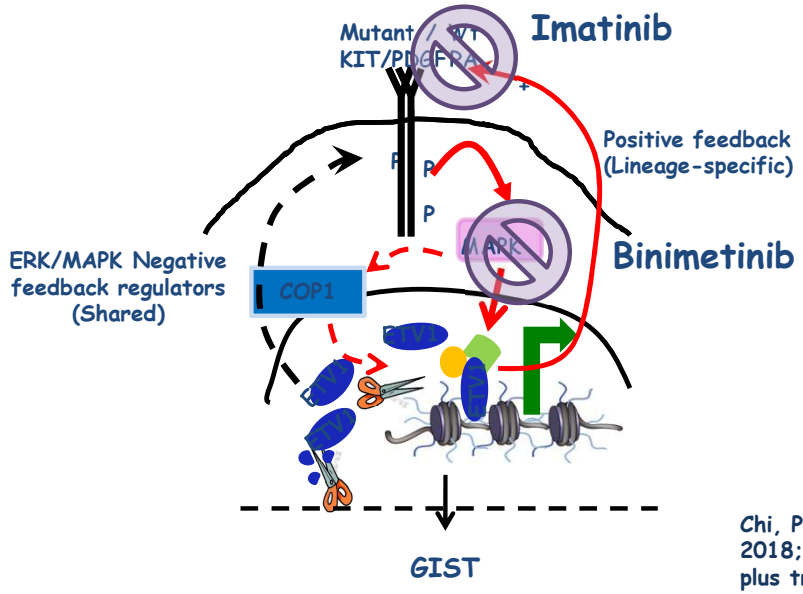




GIST882 xenografts







Advantage of targeting lineage dependence:

- Bypasses multiple upstream resistance mechanisms
- Break the positive feedback circuit of ETV1/KIT-target KIT expression regardless of mutations
- Block early adaptation and forestall resistance development and induces enhanced depth of cytotoxicity

A phase Ib/II trial of imatinib plus binimetinib in advanced GIST
- Positive trial ! Combination is also effective in SDH-deficient GIST

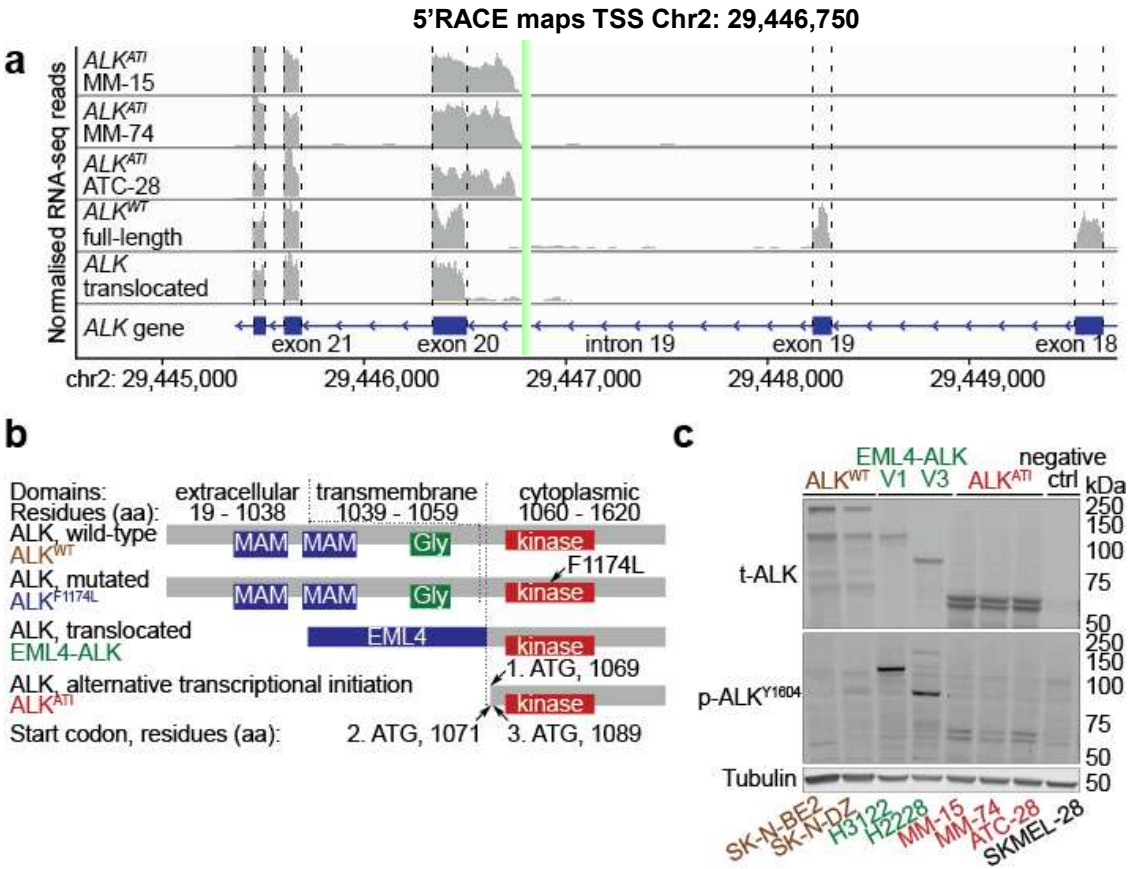
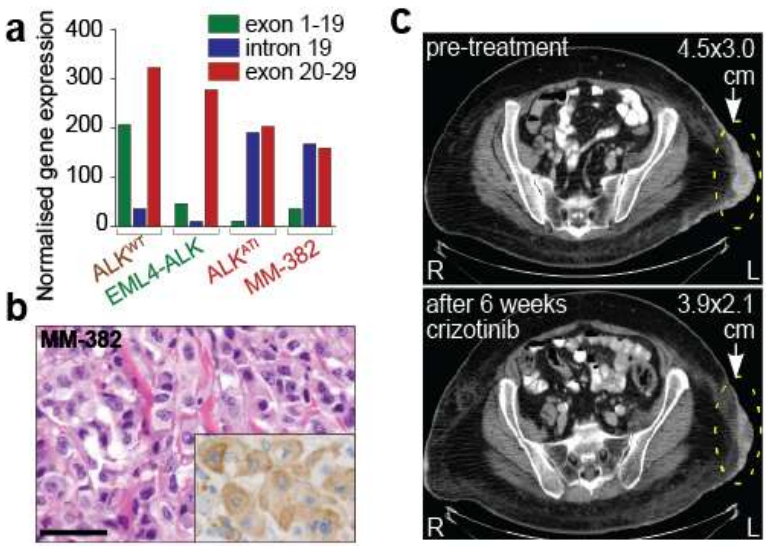
Memorial Sloan Kettering Cancer Center

A novel oncogenic ALK^{ATI} arises through de novo alternative transcriptional initiation



Alternative transcription initiation leads to expression of a novel oncogenic *ALK* isoform in cancer

- *ALK*^{ATI} present in 3.4% of all TCGA tumors; 12% of melanomas and sporadically other cancers.
- *ALK*^{ATI} functions as an independent driver, can co-occur with *BRAF/NRAS/KIT* - mutant melanoma.

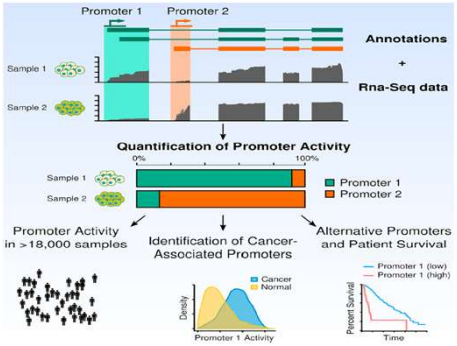


Drs. Klaus Busam, Michael Postow & Charlotte Ariyan

Wiesner T et al., Nature 2015

Memorial Sloan Kettering Cancer Center

Alternative promoter usage in cancer



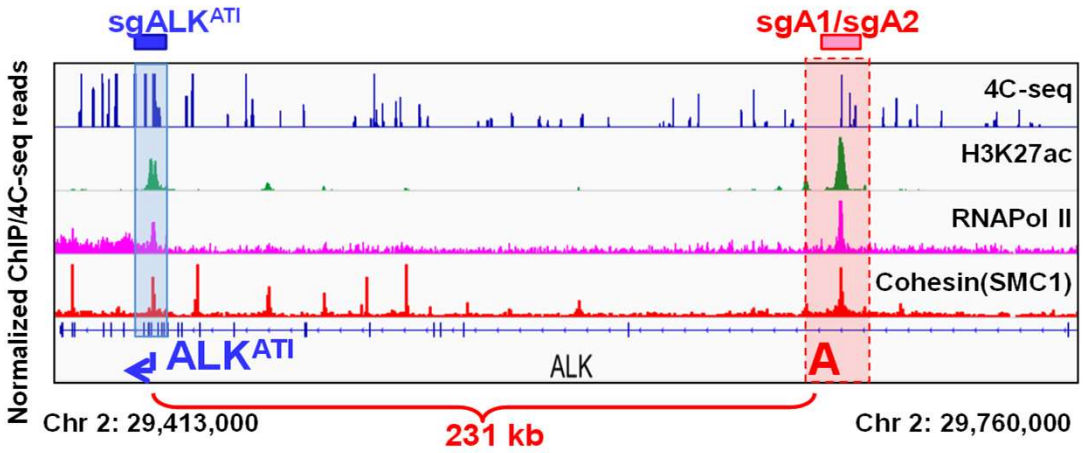
Demircioglu D., et al, Cell 2019

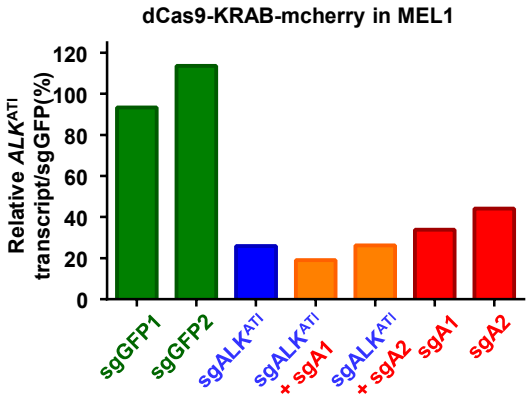
Pan-cancer transcriptome analysis reveals pervasive regulation through **alternative promoters**

- Estimation of promoter activity in 18,468 RNA-seq, 42 cancer types
- Alternative promoters display tissue-specific regulation and impact isoform diversity
- Cancer associated promoters alter the transcriptome independent from gene expression
- Patient-to-patient variation in alternative promoter is associated with survival

What regulates alternative promoter usage in cancer?

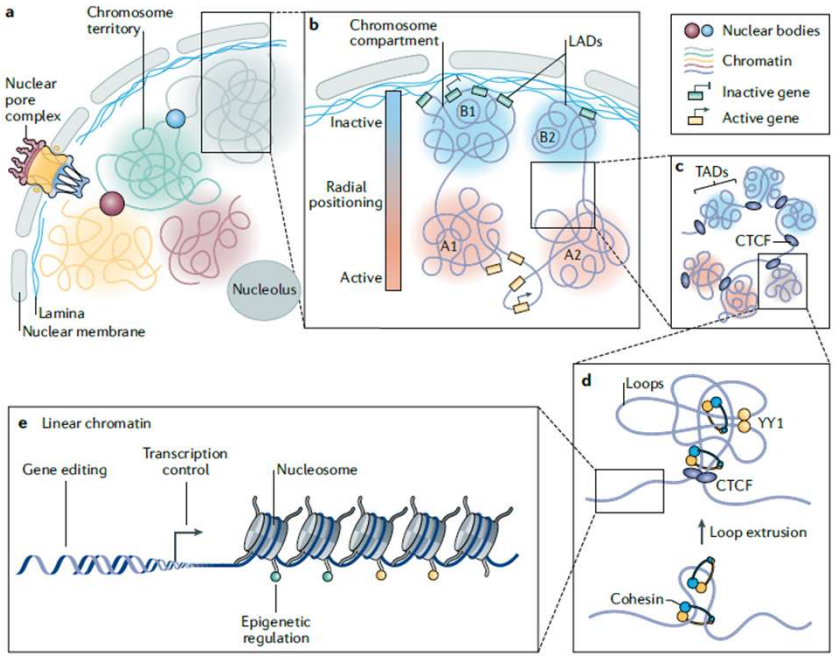
ALK^{ATI} transcriptional activation is regulated by **epigenetic mechanisms** (e.g., biallelic expression, no genomic alteration at the *ALK* locus).



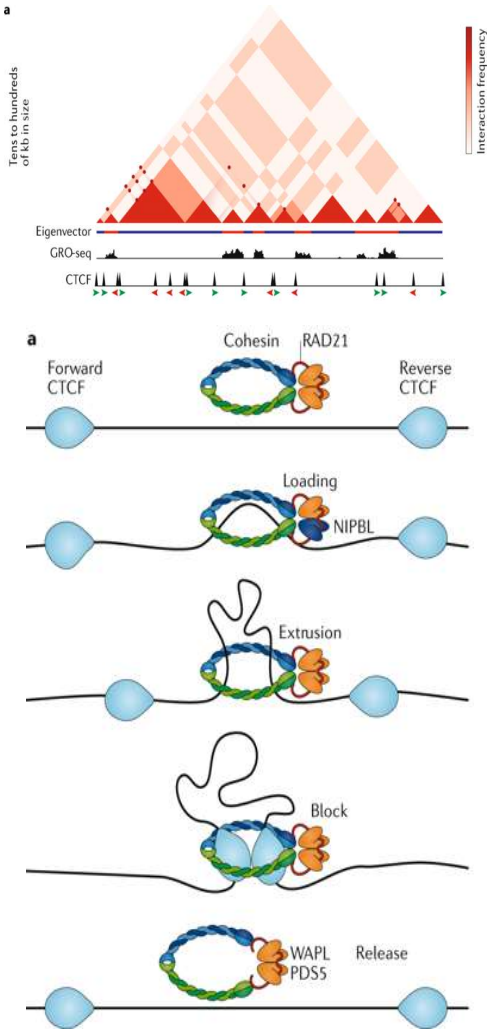


Memorial Sloan Kettering Cancer Center

Cohesin and CTCF establish and maintain the 3D genome in the nucleus



Compartments: 10-100 Mb
TADs: ~200kb-2Mb
Loops: ~10kb-1Mb



Pan-cancer driver genes and mutations analysis identifies *NIPBL* as a TSG (3.4%)

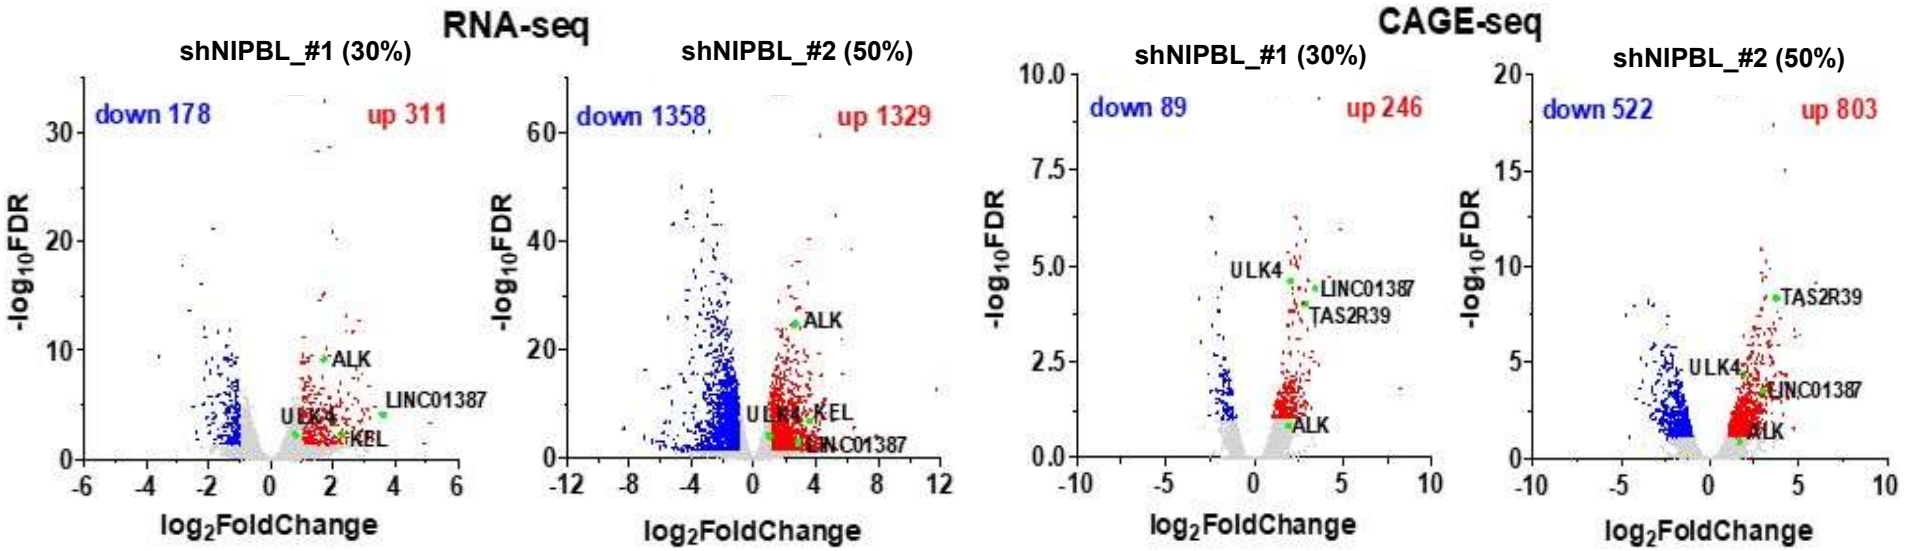
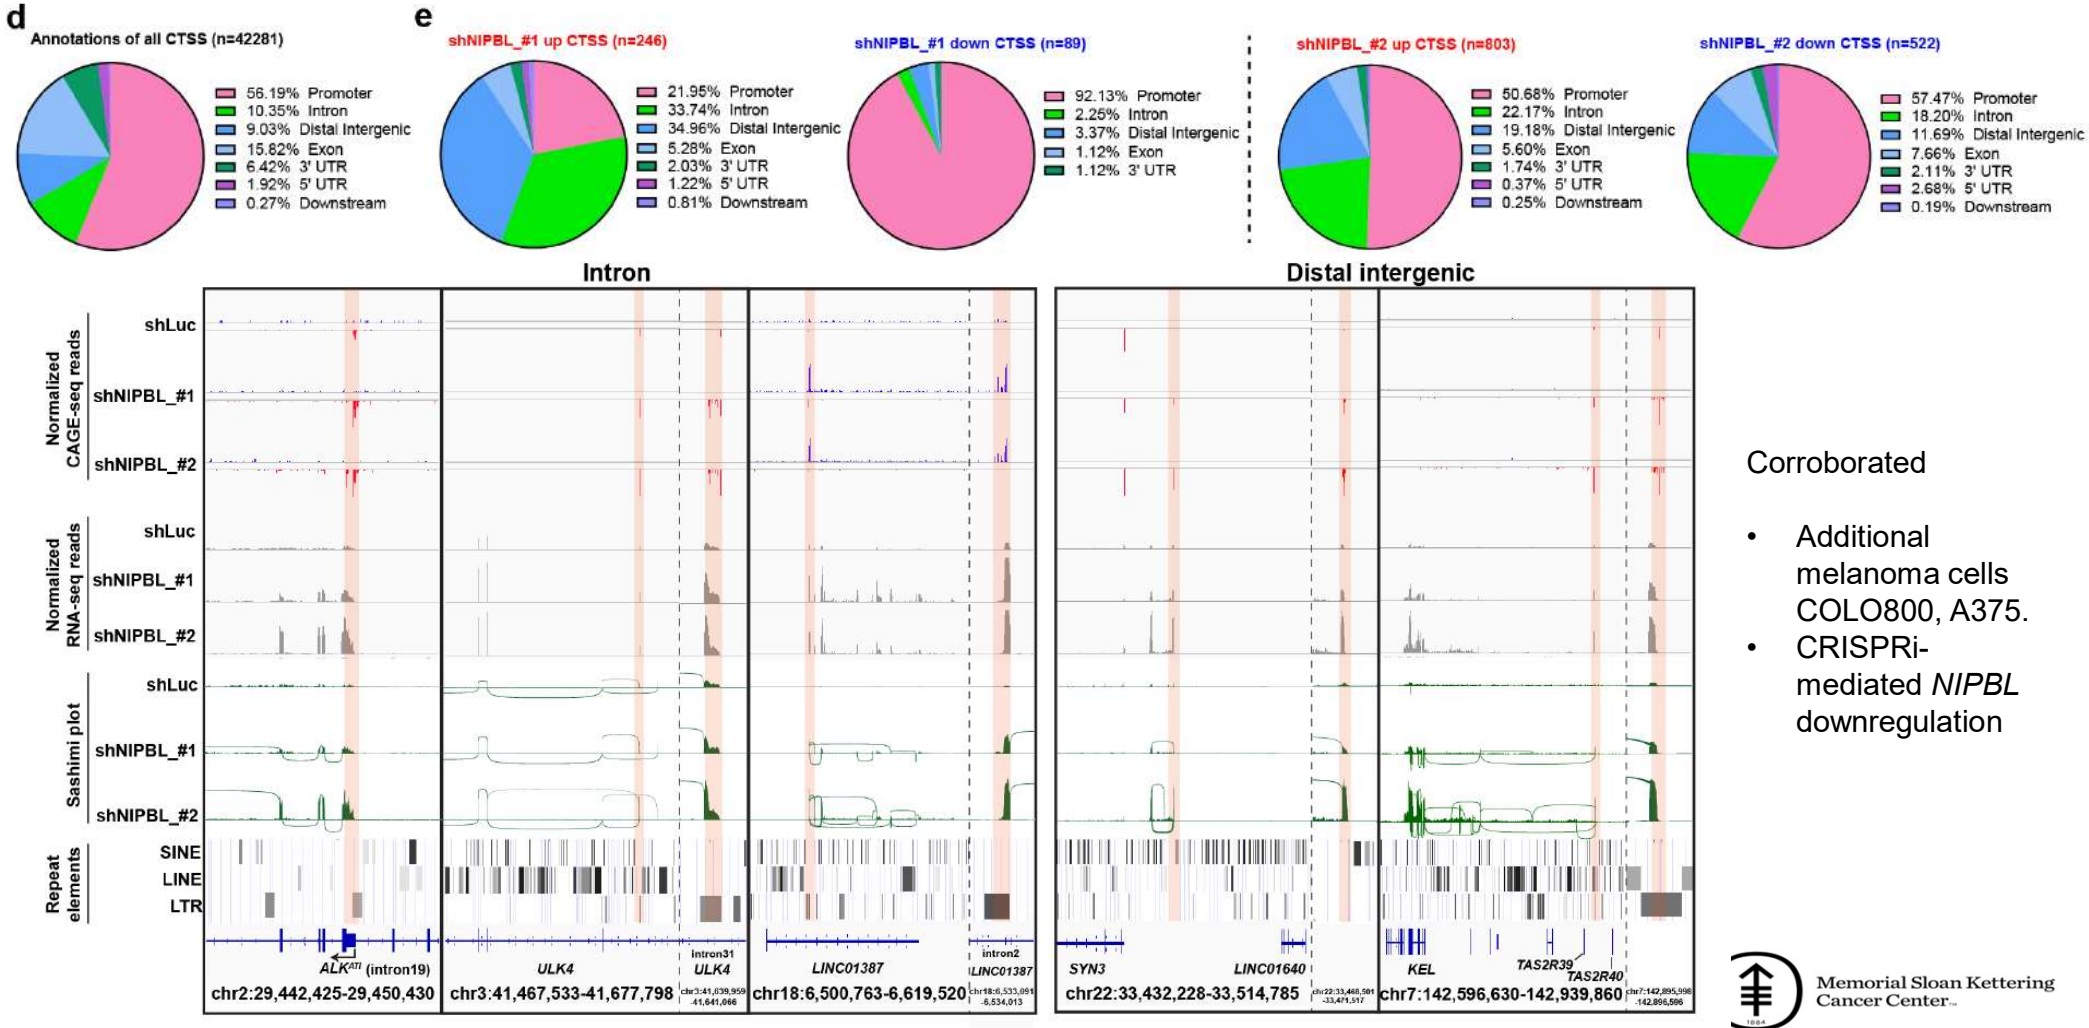
Haploinsufficiency of *NIPBL* leads to global alternative promoter usage



Wong EWP, Sahin M et al., Nat Genetics 2025

Memorial Sloan Kettering Cancer Center

NIPBL perturbation leads to alternative promoter activation in introns and intergenic regions



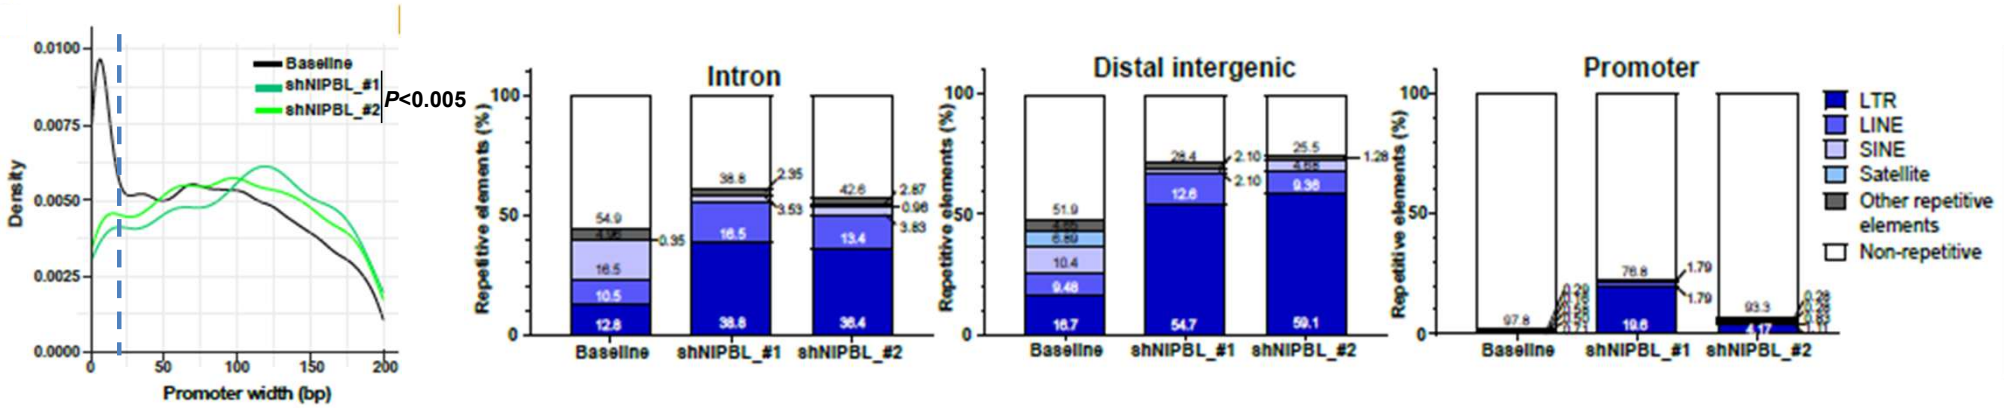
Corroborated

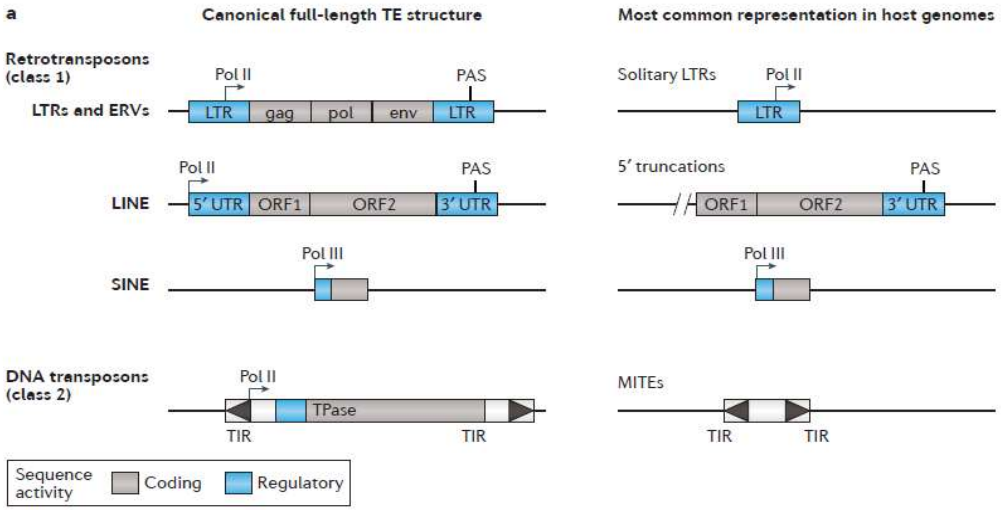
- Additional melanoma cells COLO800, A375.
- CRISPRi-mediated *NIPBL* downregulation

Memorial Sloan Kettering Cancer Center

Wong EWP, Sahin M et al., Nat Genetics 2025

NIPBL perturbation leads to alternative promoter usage arising from LTR





Chuong et al., *Nature Review Genetics* 2016

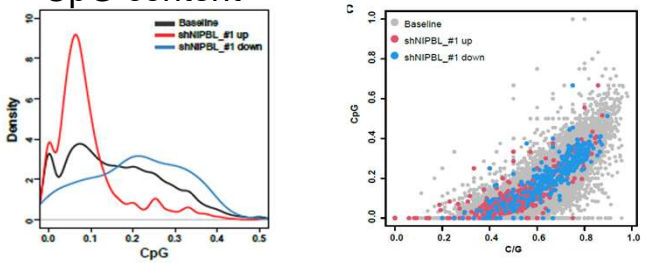
- Transposable elements: DNA sequences that once can move around in the genome
- Retrotransposons: replicate in genome via transcription and reverse transcription i.e., copy-and-paste
- LTRs account for ~8% of human genome
- LTRs harbor regulatory regions e.g., RNA Pol II and TFBS, that required for transcription
- subset of LTRs function as primary or alternative promoters in embryo and pluripotent stem cells, and sometimes in cancer
- **Usually silenced by DNA methylation and repressive chromatin modification (e.g., H3K9me3)**

Wong EWP, Sahin M et al., Nat Genetics 2025

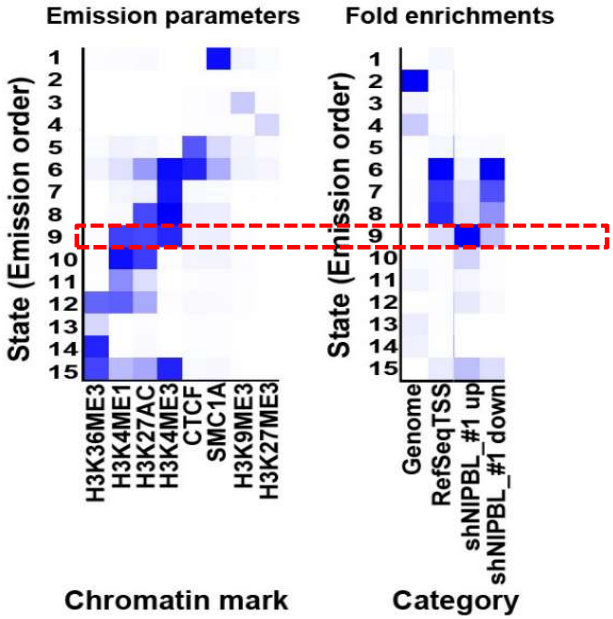
Memorial Sloan Kettering Cancer Center

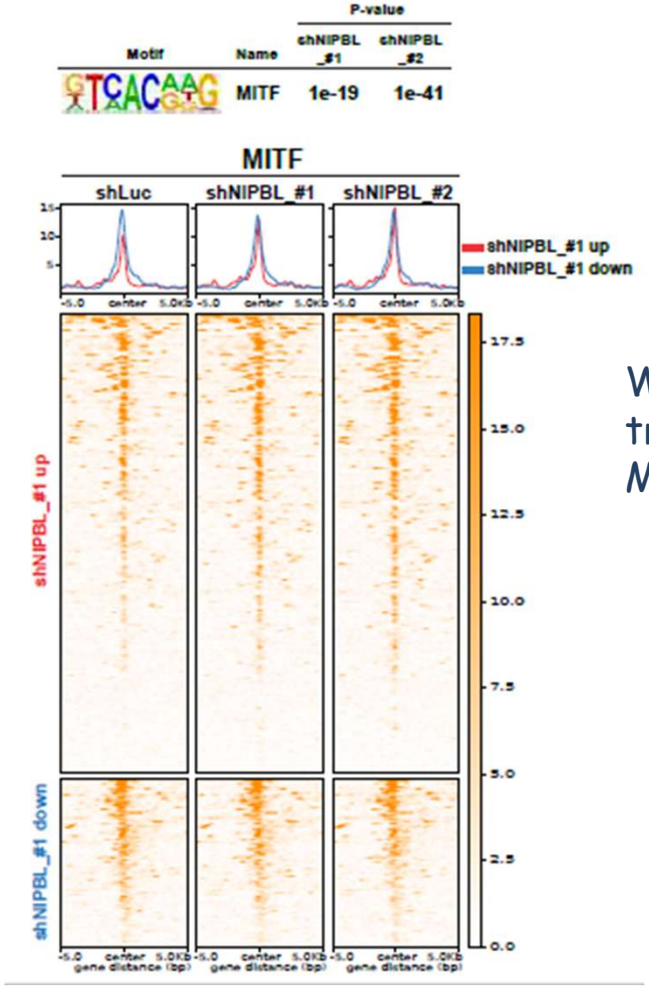
NIPBL perturbation-mediated LTR alternative promoters are characterized by open chromatin and MITF binding

CpG content



Bisulfite-free enzymatic methyl sequencing (EM-seq)
No global DNA methylation changes by *NIPBL* perturbation





What is restricting the LTR transcriptional activation by MITF at baseline?

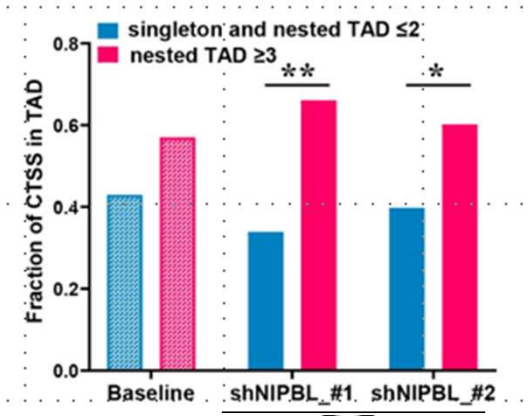
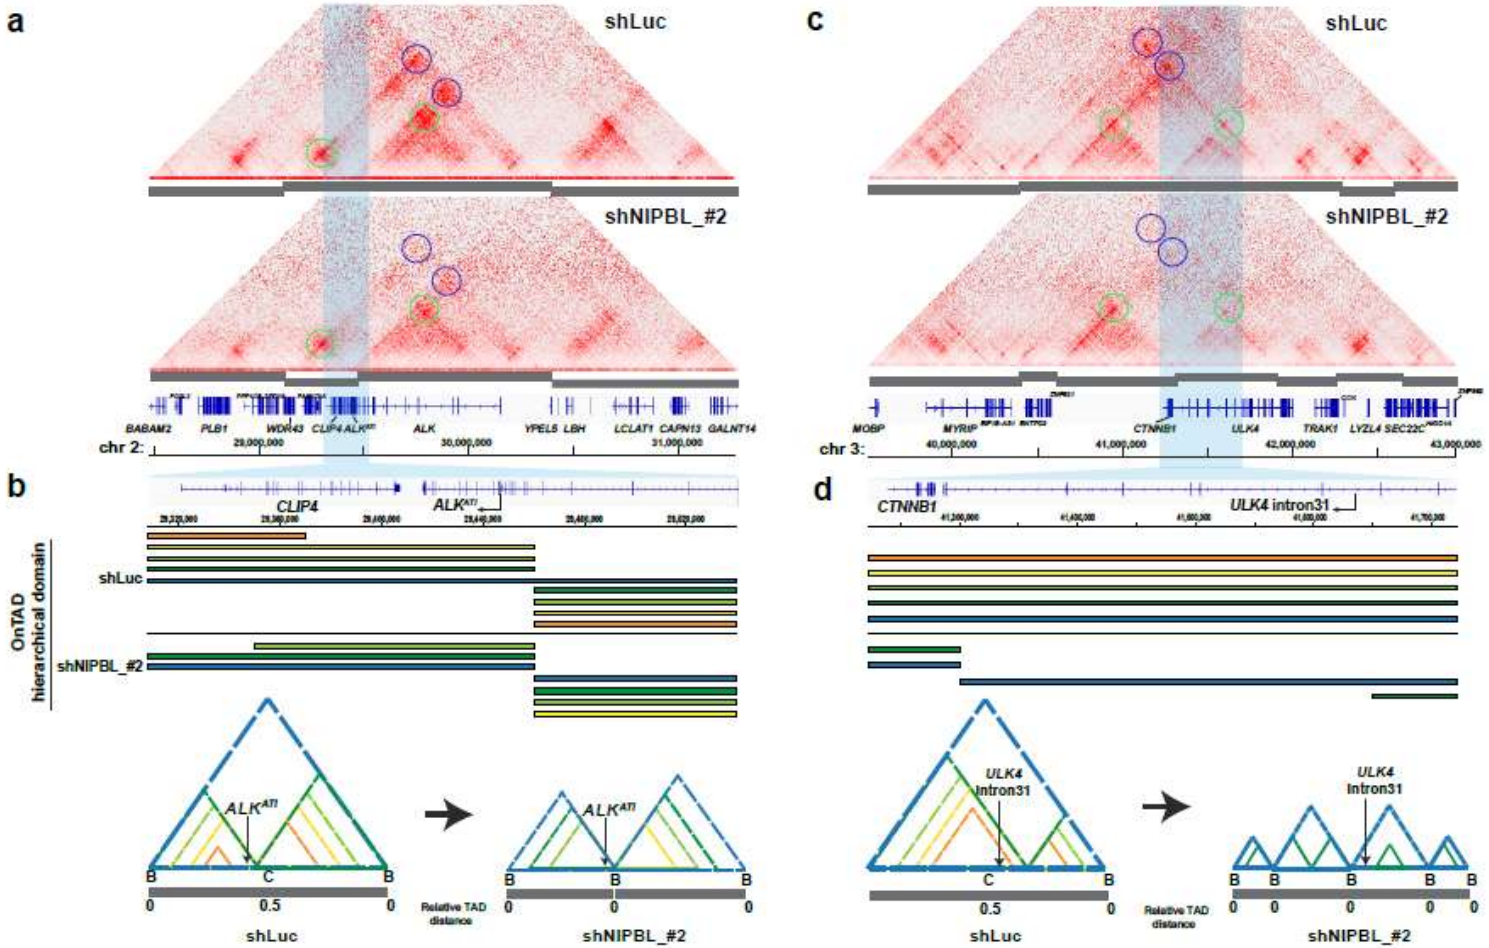
Integration of CAGE-seq and TAD hierarchy changes



Wong EWP, Sahin M et al., Nat Genetics 2025

Memorial Sloan Kettering Cancer Center

TAD hierarchy loss results in alternative promoter activation from intron/intergenic LTRs

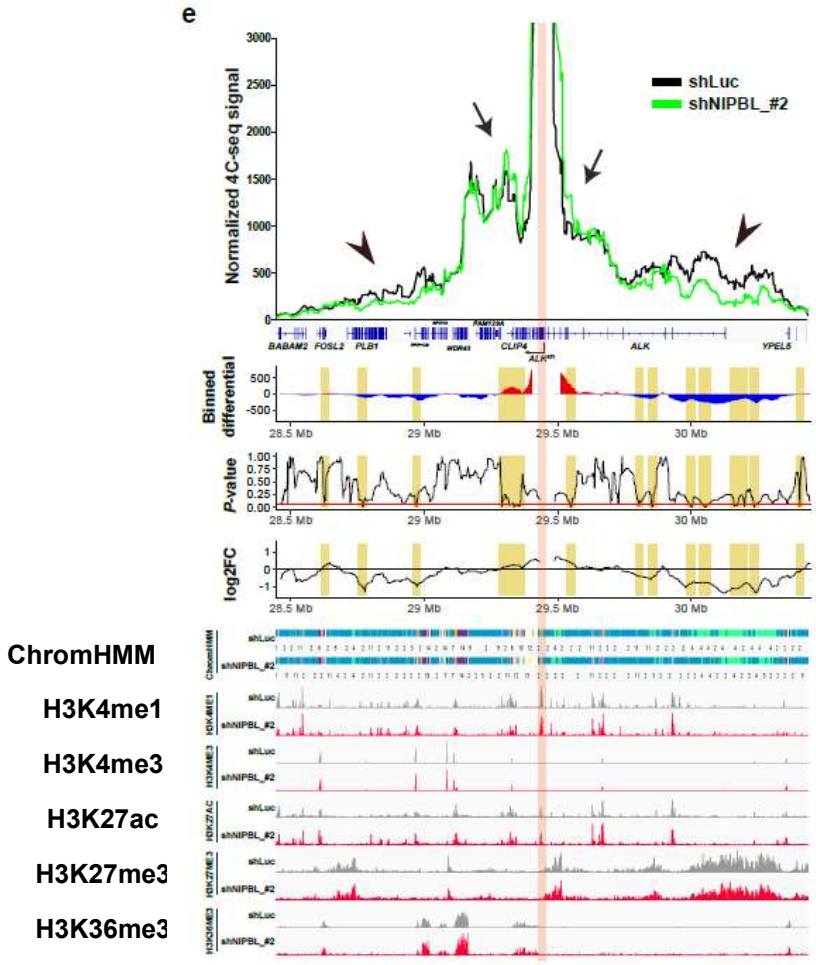


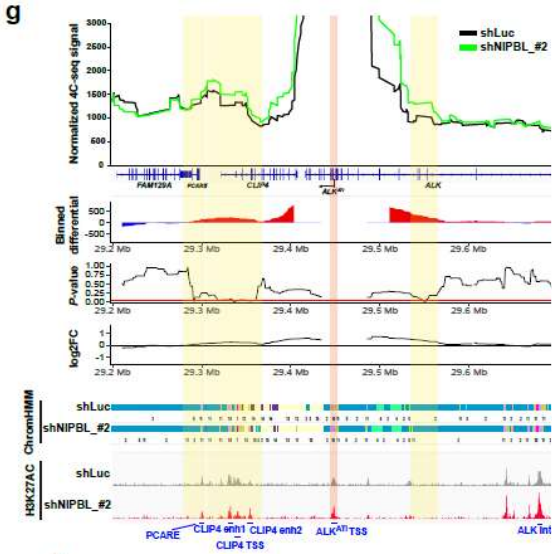
Corroborated by CRISPR/CRISPRi-mediated TAD boundary perturbation, and alternative promoter activation.

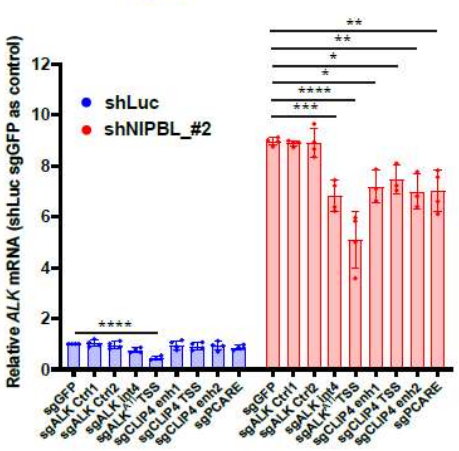
Wong EWP, Sahin M et al., in press

Memorial Sloan Kettering Cancer Center

TAD hierarchy loss results in alternative promoter activation from E-altP retargeting (switch from long-range E to short-intermediate range E)

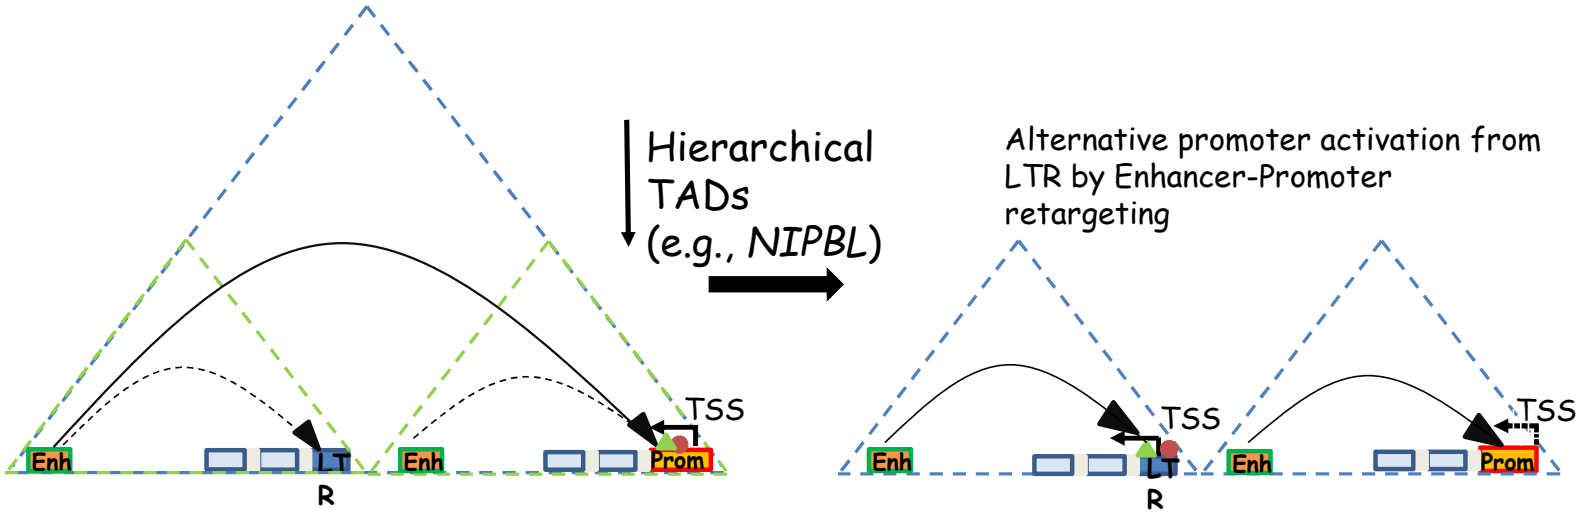






Wong EWP, Sahin M et al., Nat Genetics 2025

Alternative promoter usage in cancer via perturbation in 3D chromatin hierarchy



Hierarchical 3D chromatin organization and effects on transposable elements (TE) regulation

Physiologically - Hierarchical TAD organization suppresses LTR-mediated spurious transcription and regulate LTR co-option. A new layer of regulatory mechanism of TE expression beyond DNA and chromatin modification in human genome.

Pathologically – Perturbation in hierarchical TAD organization can lead to context-dependent oncogene activation, transcriptional diversity/plasticity and neoepitope expression through LTR co-option in cancer.
